

MC Production

- ~150-200k running slots because of the derivation production.
- The global share looks OK but we see small unbalance (between mc16 and mc15) in the EVNT share.
- We have **about 770 M events** in the production queue.
 - Only a few % is MC15.
- Resources for the future production
 - HPC is important to get samples because we may need $O(20B)$ events from now.
 - We need to improve the procedure of tasks submission. So far only Doug (from MC prod team) contributed to it.
