# DIRECT CP VIOLATION IN $K^0 \rightarrow \pi\pi$ : SM status

#### Héctor Gisbert Mullor

In collaboration with A. Pich Based on Rept.Prog.Phys. 81 (2018) no.7, 076201 IFIC, Universitat de València-CSIC XIIIth Quark Confinement and the Hadron Spectrum

Maynooth University , Ireland, 1-6 August 20

Direct CP violation in  $K^0 \rightarrow \pi \pi$ 

# What is $\varepsilon'/\varepsilon$ ?

•  $\varepsilon'/\varepsilon$  constitutes a fundamental test for our understanding of CP violation within SM: Re $(\varepsilon'/\varepsilon) \propto Im(V_{td}V_{ts}^*)$ 

$$V_{\mathsf{CKM}} = \begin{bmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{bmatrix}$$

•  $\varepsilon$  and  $\varepsilon'$  parametrize different sources of CP violation in K decays:

$$\eta_{+-} \equiv \frac{A(K_L \to \pi^+ \pi^-)}{A(K_S \to \pi^+ \pi^-)} = \varepsilon + \varepsilon', \qquad \eta_{00} \equiv \frac{A(K_L \to \pi^0 \pi^0)}{A(K_S \to \pi^0 \pi^0)} = \varepsilon - 2 \varepsilon'.$$

• Dominant effect from CP violation in K mixing is contained in  $\varepsilon$ :  $|\varepsilon| = \frac{1}{3}|\eta_{00} + 2\eta_{+-}| = (2.228 \pm 0.011) \cdot 10^{-3}.$ 

•  $\varepsilon'$  is a tinier effect and accounts for direct CP violation in K decays:

$$\operatorname{\mathsf{Re}}\left(\varepsilon'/\varepsilon\right) = \frac{1}{3}\left(1 - \left|\frac{\eta_{00}}{\eta_{+-}}\right|\right) = (16.6 \pm 2.3) \cdot 10^{-4}$$

demonstrates the existence of direct CP violation in K decays.

# Old history ...

#### • The theoretical prediction of $\varepsilon'/\varepsilon$ has a quite controversial history:

- First theoretical calculations claimed values of order 10<sup>-4</sup>, one order of magnitude smaller than the signal observed in 1993 by the CERN NA31 collaboration, giving support to the null result obtained by the E731 experiment.
- **②** The final experimental confirmation that  $\text{Re}(\varepsilon'/\varepsilon) \approx 10^{-3}$ , by NA48 and KTeV, triggering a large number of NP explanations.
- Old SM predictions had missed completely the important role of the final pion dynamics. When these contributions were taken into account, the theoretical prediction was found to be in good agreement with the experimental value.

$$\mathsf{Re}\left(arepsilon'/arepsilon
ight)|_{\mathsf{SM}}=(17\pm9)\cdot10^{-4}$$

< □ > < /□ >

(Pallante-Pich-Scimeni '01)

• Lattice QCD: Another tool to deal with non-perturbative effects.

I For many years, Lattice QCD attempts to explain

• Enhancement of the  $\Delta I = 1/2$  but remained unsuccessful.

•  $\varepsilon'/\varepsilon$  were unreliable (some of them even negative).

The situation has changed due to the development of sophisticated techniques and the increasing power of modern computers. Explaining:

• Successful 
$$\Delta I = 3/2 \ K \to \pi \pi$$
: •

 $\sqrt{\frac{3}{2}} \operatorname{Re} A_2 = (1.50 \pm 0.17) \cdot 10^{-8} \operatorname{GeV} 0.1 \sigma (\text{RBC-UKQCD '15})$ 

• First statistically-significant signal of  $\Delta I = 1/2$  enhancement:

 $\sqrt{\frac{3}{2}} \operatorname{Re} A_0 = (4.66 \pm 1.61) \cdot 10^{-7} \operatorname{GeV} \quad 1.0 \sigma (\text{RBC-UKQCD '15})$ 

Solution QCD estimation of  $\varepsilon'/\varepsilon$ :

$$\operatorname{Re}\left(\varepsilon'/\varepsilon\right) = \left(1.4\pm7.0
ight)\cdot10^{-4}\ {
m 2.1}\sigma\left(\operatorname{RBC-UKQCD}\ {
m '15}
ight)$$

#### • Limitations of lattice result:

$${
m Re}\left(arepsilon'/arepsilon
ight) = \left(1.4\pm7.0
ight)\cdot10^{-4}\,{
m 2.1}\,\sigma\,({
m RBC}$$
-ukqcd '15)

- This discrepancy has revived some of the old SM calculations predicting low values of  $\varepsilon'/\varepsilon$  (missing AGAIN the crucial pion dynamics!) and has triggered several analysis of possible contributions from NP.
- Before claiming any evidence for NP, one should realize the technical limitations of the current lattice result:

$$\begin{split} \delta_0 &= +(23.8 \pm 5.0)^\circ \ 2.9 \,\sigma \,(\text{RBC-UKQCD '15}) \,\swarrow \\ \delta_0|_{\text{exp}} &= +(39.2 \pm 1.5)^\circ \\ \delta_2 &= -(11.6 \pm 2.8)^\circ \ 1.0 \,\sigma \,(\text{RBC-UKQCD '15}) \,\checkmark \\ \delta_2|_{\text{exp}} &= -(8.5 \pm 1.5)^\circ \end{split}$$

#### Large uncertainty in $\delta_0$ !

**2** Analicity: 
$$Dis(A_I) \propto Abs(A_I)$$

**(a)** Message: Large  $\delta_0 \longrightarrow$  Large  $Abs(A_0) \longrightarrow$  Large  $Dis(A_0)$ 

- Lattice still doesn't have a good control of the I = 0 amplitudes.
- Still premature to derive strong implications and RBC-UKQCD collaboration is making efforts to improve the statistics.
- Future lattice results will show if the discrepancy stays or not.

## Need of updated $\varepsilon'/\varepsilon$ within SM

 Although Pallante-Pich-Scimeni '01 within a theoretical framework which takes into account the important role of the pion dynamics obtained a theoretical value compatible with the experimental result.

$${\sf Re}\left(arepsilon'/arepsilon
ight)|_{\sf SM}=(17\pm9)\cdot10^{-4}$$

- A lot of improvements since 2001:
  - Better knowledge of Low energy constants (LECs),
  - Much better precision of quark masses,
  - Strong coupling constant,
  - ...
- It is convenient to perform an updated of  $\varepsilon'/\varepsilon$ .

#### Theoretical framework

#### Short-distance description

< ロト < 同ト < ヨト < ヨト

## Chiral Perturbation Theory ( $\chi$ PT) description

- QCD at low energies is  $\chi$ PT.
- χPT formulation is a <u>consistent framework</u> to describe the pseudoscalar-octet dynamics.
- Perturbative expansion in powers of  $p^2/\Lambda_{\chi}^2$  where  $\Lambda_{\chi} \sim 1$ GeV.
- Chiral symmetry fix the allowed  $\chi PT$  operators, at given order in *p*.
- $\mathcal{O}(G_F p^2)$ : Goldstone Interactions  $(\pi, K, \eta)$

$$\mathcal{L}_{2}^{\Delta S=1} = G_{8} F^{4} \operatorname{Tr}(\lambda L_{\mu} L^{\mu}) + G_{27} F^{4} \left( L_{\mu 23} L_{11}^{\mu} + \frac{2}{3} L_{\mu 21} L_{13}^{\mu} \right)$$

$$S_{2,27} = -\frac{G_F}{\sqrt{2}} V_{ud} V_{us}^* g_{8,27}$$
;  $L_{\mu} = -iU^{\dagger} D_{\mu} U$ ;  $\lambda_{ij} \equiv \delta_{i3} \delta_{j2}$ ;  $U \equiv \exp\{i\sqrt{2}\phi/F\}$ 

- Short-distance dynamics encoded in Low-Energy Couplings.
- LECs can be determined at  $N_C \rightarrow \infty$  (matching)

G

### $K \rightarrow \pi\pi$ Isospin amplitudes

Isospin decomposition:

$$\begin{split} &A[K^0 \to \pi^+ \pi^-] = A_0 \, e^{i\chi_0} \, + \, \frac{1}{\sqrt{2}} \, A_2 \, e^{i\chi_2} \, = \, \mathcal{A}_{1/2} \, + \, \frac{1}{\sqrt{2}} \left( \mathcal{A}_{3/2} \, + \, \mathcal{A}_{5/2} \right) \\ &A[K^0 \to \pi^0 \pi^0] \, = \, A_0 \, e^{i\chi_0} \, - \, \sqrt{2} \, A_2 \, e^{i\chi_2} \, = \, \mathcal{A}_{1/2} \, + \, \sqrt{2} \left( \mathcal{A}_{3/2} \, + \, \mathcal{A}_{5/2} \right) \\ &A[K^+ \to \pi^+ \pi^0] \, = \, \frac{3}{2} \, \mathcal{A}_2^+ \, e^{i\chi_2^+} \, = \, \frac{3}{2} \left( \mathcal{A}_{3/2} \, - \, \frac{2}{3} \, \mathcal{A}_{5/2} \right). \end{split}$$

•  $\chi_I$  can be identified with the S-wave  $\pi\pi$  scattering phase shifts  $\delta_I(M_K)$ .

• 
$$\mathcal{A}_n = -G_8 F_\pi \left\{ (M_K^2 - M_\pi^2) \mathcal{A}_n^{(8)} - e^2 F_\pi^2 g_{\text{ewk}} \mathcal{A}_n^{(g)} \right\} - G_{27} F_\pi (M_K^2 - M_\pi^2) \mathcal{A}_n^{(27)}$$
  
where  $\mathcal{A}_n^{(X)} = \mathfrak{s}_n^{(X)} \left[ 1 + \Delta_L \mathcal{A}_n^{(X)} + \Delta_C \mathcal{A}_n^{(X)} \right].$ 

•  $\varepsilon'$  in terms of the  $K \to \pi\pi$  isospin amplitudes,

$$\varepsilon' = -\frac{i}{\sqrt{2}} e^{i(\chi_2 - \chi_0)} \omega \left[ \frac{\mathrm{Im}A_0}{\mathrm{Re}A_0} - \frac{\mathrm{Im}A_2}{\mathrm{Re}A_2} \right]$$

ΔI = 1/2 rule: ε' is suppresed by the ratio ω = ReA<sub>2</sub>/ReA<sub>0</sub> ≈ 1/22.
 Strong Final States Interactions (FSI): χ<sub>0</sub> - χ<sub>2</sub> ≈ δ<sub>0</sub> - δ<sub>2</sub> ≈ 45°.

## Estimation of the LECs

- From phenomenological data or with additional input from theory.
- Principle of calculation LECs: perform a matching between two EFTs.
- In the large  $N_C$  limit, the T-product of two colour singlet currents factorizes:

$$\langle J \cdot J \rangle = \langle J \rangle \langle J \rangle \left\{ 1 + \mathcal{O}\left(\frac{1}{N_c}\right) \right\}$$

Since quark currents have a well-known representation in  $\chi$ PT, the matching between the EFTs can be done at leading order in  $1/N_C$ .

• Weak couplings of  $\mathcal{O}(G_F p^2)$  and  $\mathcal{O}(e^2 G_8 p^0)$ :

$$g_8^{\infty} = -\frac{2}{5} C_1(\mu_{\text{SD}}) + \frac{3}{5} C_2(\mu_{\text{SD}}) + C_4(\mu_{\text{SD}}) - 16 L_5 B(\mu_{\text{SD}}) C_6(\mu_{\text{SD}}),$$
  

$$g_{27}^{\infty} = \frac{3}{5} [C_1(\mu_{\text{SD}}) + C_2(\mu_{\text{SD}})],$$
  

$$(e^2 g_8 g_{\text{ewk}})^{\infty} = -3 B(\mu_{\text{SD}}) C_8(\mu_{\text{SD}}) - \frac{16}{3} B(\mu_{\text{SD}}) C_6(\mu_{\text{SD}}) e^2 (K_9 - 2 K_{10}).$$

where 
$$B(\mu_{\text{SD}}) \equiv \frac{\langle \bar{q}q \rangle}{F_{\pi}^3} = \left[\frac{M_K^2}{(m_s + m_d)(\mu_{\text{SD}})F_{\pi}}\right]^2 \left[1 - \frac{16M_K^2}{F_{\pi}^2}(2L_8 - L_5) + \frac{8M_{\pi}^2}{F_{\pi}^2}L_5\right]$$

## Simplified Estimate of $\varepsilon'/\varepsilon$

- OP violation comes mainly from the QCD and EW penguin operators.
- **2** Chiral enhancement of the operators  $(V A) \otimes (V + A)$ .
- **6** Good numerical approximation to consider only  $Q_{6,8}$  operators.
- Simplified estimate:

$$\frac{\text{Re}(\varepsilon'/\varepsilon)}{\text{IB}} \approx 2.2 \cdot 10^{-3} \left\{ B_6^{(1/2)} \left( 1 - \underbrace{\Omega_{\text{eff}}}_{\text{IB}} \right) - 0.48 B_8^{(3/2)} \right\}$$
$$\underset{\text{IB} \equiv O[(m_u - m_d)p^2, e^2p^2]}{\text{IB} \equiv O[(m_u - m_d)p^2, e^2p^2]}$$

• Large N<sub>C</sub>:

$$B_6^{(1/2)} = B_8^{(3/2)} = 1 \longrightarrow \operatorname{Re}(\varepsilon'/\varepsilon) \approx 10.0 \cdot 10^{-4} \sim \mathcal{O}(10^{-3})$$

• Buras-Gorbahn-Jäger-Jamin '15:

$$B_6^{(1/2)} =$$
 0.57,  $B_8^{(3/2)} =$  0.76  $\rightarrow \operatorname{Re}(\varepsilon'/\varepsilon) \approx 2.6 \cdot 10^{-4} \sim \mathcal{O}(10^{-4})$ 

#### Strong cancellation between $Q_6$ and $Q_8$ !

## Anatomy of $\varepsilon'/\varepsilon$ calculation

**O**(p<sup>4</sup>)  $\chi$ PT Loops: Large correction  $\Delta_L A_n^{(\chi)} \rightarrow \frac{1}{N_C} \log \left(\frac{\mu}{M_{\pi}}\right) \sim \frac{1}{3} \times 2$ 

$$\begin{split} \mathcal{A}_{n}^{(X)} &= \mathbf{a}_{n}^{(X)} \begin{bmatrix} 1 + \Delta_{L} \mathcal{A}_{n}^{(X)} + \Delta_{C} \mathcal{A}_{n}^{(X)} \end{bmatrix} & \stackrel{\text{Pallante-Pich-Scimemi}}{\text{Gabert-Pich}} \\ \Delta_{L} \mathcal{A}_{1/2}^{(8)} &= 0.27 \pm 0.05 \pm 0.47 \, i \quad ; \quad \Delta_{L} \mathcal{A}_{3/2}^{(27)} &= -0.04 \pm 0.05 - 0.21 \, i \\ \Delta_{L} \mathcal{A}_{1/2}^{(27)} &= 1.03 \pm 0.63 \pm 0.47 \, i \quad ; \quad \Delta_{L} \mathcal{A}_{3/2}^{(27)} &= -0.50 \pm 0.19 - 0.21 \, i \end{split}$$

 O(p<sup>4</sup>) LECs fixed at N<sub>C</sub> → ∞: Small correction Δ<sub>C</sub>A<sup>(X)</sup><sub>n</sub>
  $\frac{1}{N_C} \log \left(\frac{M_W}{\mu}\right) \sim \frac{1}{3} \times 4$  but no large logarithm in the matching!

## Anatomy of $\varepsilon'/\varepsilon$ calculation

**O**(p<sup>4</sup>)  $\chi$ PT Loops: Large correction  $\Delta_L A_n^{(\chi)} \rightarrow \frac{1}{N_C} \log \left(\frac{\mu}{M_{\pi}}\right) \sim \frac{1}{3} \times 2$ 

$$\begin{split} \mathcal{A}_{n}^{(X)} &= \mathbf{a}_{n}^{(X)} \begin{bmatrix} 1 + \Delta_{L} \mathcal{A}_{n}^{(X)} + \Delta_{C} \mathcal{A}_{n}^{(X)} \end{bmatrix} & \stackrel{\text{Pallante-Pich-Scimemi}}{\text{Gabert-Pich}} \\ \Delta_{L} \mathcal{A}_{1/2}^{(8)} &= 0.27 \pm 0.05 \pm 0.47 \, i \quad ; \\ \Delta_{L} \mathcal{A}_{1/2}^{(27)} &= 1.03 \pm 0.63 \pm 0.47 \, i \quad ; \quad \Delta_{L} \mathcal{A}_{3/2}^{(27)} &= -0.04 \pm 0.05 - 0.21 \, i \\ \Delta_{L} \mathcal{A}_{1/2}^{(g)} &= 0.27 \pm 0.01 \pm 0.47 \, i \quad ; \quad \Delta_{L} \mathcal{A}_{3/2}^{(g)} &= -0.50 \pm 0.19 - 0.21 \, i \end{split}$$

② O(p<sup>4</sup>) LECs fixed at N<sub>C</sub> → ∞: Small correction  $\Delta_{C} \mathcal{A}_{n}^{(X)}$  $\frac{1}{N_{C}} \log \left(\frac{M_{W}}{\mu}\right) \sim \frac{1}{3} \times 4$  but no large logarithm in the matching!

## SM prediction of $\operatorname{Re}\left(\varepsilon'/\varepsilon\right)$

 $\operatorname{\mathsf{Re}}\left(\varepsilon'/\varepsilon\right)|_{\operatorname{\mathsf{SM}}} = \left(15 \ \pm \ 2_{\mu} \ \pm \ 2_{m_s} \ \pm \ 2_{\Omega_{\operatorname{eff}}} \ \pm \ 6_{\frac{1}{N_c}}\right) \cdot 10^{-4}$ 

(HG - A.Pich, arXiv:1712.06147)

Direct CP violation in  $K^0 \rightarrow \pi \pi$ 

### Needed Improvements

<ul> <li>Wilson coefficients at NNLO</li> </ul>	(Cerdà et al)
$\bullet$ Updated value of $\Omega_{eff}$	(Cirigliano et al)
• $g_8 g_{\rm ew}$ at NLO in $1/N_C$	(A. Pich and Rodriguez-Sanchez)
<ul> <li>g<sub>8</sub> and higher-order LECs at NLO</li> </ul>	New ideas needed
• $\chi$ PT logarithms at NNLO	Feasible
• Improved lattice input	Expected
Best strategy: $\chi$ PT (amplitudes) + Lattice (LECs)	

æ

イロト イヨト イヨト イヨト

SM prediction of  $\varepsilon'/\varepsilon$  agrees well with the mesured value! Re  $(\varepsilon'/\varepsilon)|_{\text{SM}} = (15 \pm 2_{\mu} \pm 2_{m_s} \pm 2_{\Omega_{\text{eff}}} \pm 6_{\frac{1}{N_c}}) \cdot 10^{-4}$ Re  $(\varepsilon'/\varepsilon)|_{\text{exp}} = (16.6 \pm 2.3) \cdot 10^{-4}$ 

### Amplitudes at NLO of $K \rightarrow \pi\pi \mathcal{O}(p^4, (m_u - m_d)p^2, e^2p^0, e^2p^2)$

Including strong isospin violation and electromagnetic corrections (Cirigliano et al '04)

$$\mathcal{A}_{n} = \mathbf{G}_{27} F_{\pi} \left( M_{K}^{2} - M_{\pi}^{2} \right) \mathcal{A}_{n}^{(27)} + \mathbf{G}_{8} F_{\pi} \left\{ \left( M_{K}^{2} - M_{\pi}^{2} \right) \left[ \mathcal{A}_{n}^{(8)} + \varepsilon^{(2)} \mathcal{A}_{n}^{(\varepsilon)} \right] - e^{2} F_{\pi}^{2} \left[ \mathcal{A}_{n}^{(\gamma)} + \mathbf{Z} \mathcal{A}_{n}^{(Z)} + \mathbf{g}_{\text{ewk}} \mathcal{A}_{n}^{(g)} \right] \right\}$$

where 
$$\mathcal{A}_{n}^{(X)} = a_{n}^{(X)} \left[ 1 + \Delta_{L} \mathcal{A}_{n}^{(X)} + \Delta_{C} \mathcal{A}_{n}^{(X)} \right]$$
;  $X = 27, 8, \varepsilon, \gamma, Z, g.$   
 $G_{8,27} = -\frac{G_{F}}{\sqrt{2}} V_{ud} V_{us}^{*} g_{8,27}, \quad \varepsilon^{(2)} = (\sqrt{3}/4)(m_{d} - m_{u})/(m_{s} - \hat{m}) \approx 0.011; \quad Z \approx (M_{\pi^{\pm}}^{2} - M_{\pi_{0}}^{2})/(2e^{2}F_{\pi}^{2}) \approx 0.8$ 

## Simplified Estimate of $\varepsilon'/\varepsilon$

- CP violation comes mainly from the QCD and EW penguin operators.
   QCD: Q<sub>3,4</sub> (v-A)⊗(v-A) and Q<sub>5,6</sub> (v-A)⊗(v+A).
   EW: Q<sub>7,8</sub> (v-A)⊗(v+A) and Q<sub>9,10</sub> (v-A)⊗(v-A).
- **2** Chiral enhancement of the operators  $(V A) \otimes (V + A)$ .
  - Fierz rearrangement of numerically relevant operators:

 $\begin{aligned} & Q_{4} = \sum_{q} (\bar{s}q)_{V-A} (\bar{q}d)_{V-A}, \quad Q_{10} = \frac{3}{2} \sum_{q} e_{q} (\bar{s}q)_{V-A} (\bar{q}d)_{V-A}, \\ & Q_{6} = \sum_{q} (\bar{s}_{L}q_{R}) (\bar{q}_{R}d_{L}), \quad Q_{8} = -12 \sum_{q} e_{q} (\bar{s}_{L}q_{R}) (\bar{q}_{R}d_{L}). \end{aligned}$ 

• Large  $N_C$ :  $\langle J \cdot J \rangle = \langle J \rangle \langle J \rangle \{1 + \mathcal{O}(1/N_C)\}$ 

 $\begin{aligned} \mathcal{A}_{LL} &\equiv \langle \pi^+\pi^- | (\bar{\mathfrak{s}}_L\gamma^\mu u_L) (\bar{u}_L\gamma_\mu d_L) | \mathcal{K}^0 \rangle = \langle \pi^+ | \bar{u}_L\gamma_\mu d_L | 0 \rangle \langle \pi^- | \bar{\mathfrak{s}}_L\gamma^\mu u_L | \mathcal{K}^0 \rangle = \frac{i\sqrt{2}}{4} F_\pi \left( \frac{M_K^2}{m_d(\mu) + m_s(\mu)} \right), \\ \mathcal{A}_{LR}(\mu) &\equiv \langle \pi^+\pi^- | (\bar{\mathfrak{s}}_L u_R) (\bar{u}_R d_L) | \mathcal{K}^0 \rangle = \langle \pi^+ | \bar{u}_R d_L | 0 \rangle \langle \pi^- | \bar{\mathfrak{s}}_L u_R | \mathcal{K}^0 \rangle = \frac{i\sqrt{2}}{4} F_\pi \left[ \frac{M_K^2}{m_d(\mu) + m_s(\mu)} \right]^2. \end{aligned}$   $At \ \mu = 1 \text{ GeV: } \mathcal{A}_{LR}(\mu) / \mathcal{A}_{LL} \sim \frac{M_K^2}{m_d(\mu) + m_d(\mu)^2} \sim 14. \end{aligned}$ 

**Solution** Good numerical approximation to consider only  $Q_{6,8}$  operators.

H. Gisbert (IFIC)

Ignoring all other contributions to the CP-violating decay amplitudes:

$$\begin{split} \mathrm{Im} A_{0}|_{Q_{6}} &= \frac{G_{F}}{\sqrt{2}} A^{2} \lambda^{5} \eta \, V_{td} \, V_{ts}^{*} \, y_{6}(\mu) \, 4\sqrt{2} \, \left(F_{K} - F_{\pi}\right) \left[\frac{M_{K}^{2}}{m_{d}(\mu) + m_{s}(\mu)}\right]^{2} \, B_{6}^{(1/2)} \, , \\ \mathrm{Im} A_{2}|_{Q_{8}} &= -\frac{G_{F}}{\sqrt{2}} \, A^{2} \lambda^{5} \eta \, V_{td} \, V_{ts}^{*} \, y_{8}(\mu) \, 2 \, F_{\pi} \, \left[\frac{M_{K}^{2}}{m_{d}(\mu) + m_{s}(\mu)}\right]^{2} \, B_{8}^{(3/2)} \, . \end{split}$$

Including the isospin breaking effects (Cirigliano-Ecker-Neufeld-Pich '03):

$$\operatorname{Re}(\varepsilon'/\varepsilon) = -\frac{\omega_{+}}{\sqrt{2}|\varepsilon|} \left[ \frac{\operatorname{Im} A_{0}^{(0)}}{\operatorname{Re} A_{0}^{(0)}} \left(1 - \Omega_{\mathrm{eff}}\right) - \frac{\operatorname{Im} A_{2}^{\mathrm{emp}}}{\operatorname{Re} A_{2}^{(0)}} \right]$$

with  $\omega \equiv \frac{\text{Re}A_2}{\text{Re}A_0} = \omega_+ (1 + f_{5/2})$ ,  $\omega_+ \equiv \frac{\text{Re}A_2^+}{\text{Re}A_0}$  and  $\Omega_{\text{eff}} = 0.06 \pm 0.08$ .

Simplified estimate: Strong cancellation between  $Q_6$  and  $Q_8$ !

$${
m Re}(arepsilon'/arepsilon) \, pprox \, 2.2 \cdot 10^{-3} \, \left\{ B_6^{(1/2)} \, (1 - \Omega_{
m eff}) - 0.48 \; B_8^{(3/2)} 
ight\}$$

• Large N<sub>C</sub>:

 $\textit{B}_6^{(1/2)} = \textit{B}_8^{(3/2)} = 1 \text{ and } \Omega_{\text{eff}} = 0.06 \longrightarrow \operatorname{Re}(\varepsilon'/\varepsilon) \approx 10.0 \cdot 10^{-4} \sim \mathcal{O}(10^{-3})$ 

• Buras-Gorbahn-Jäger-Jamin '15:

 ${}^{(1/2)}_6 = \text{0.57, } {B_8^{(3/2)}} = \text{0.76 and } \Omega_{\text{eff}} = \text{0.15} \rightarrow \operatorname{Re}(\varepsilon'/\varepsilon) \approx 2.6 \cdot 10^{-4} \sim \mathcal{O}(10^{-4})$ 

## BBG Model

$$\mathcal{L}_{\mathsf{BBG}} = \frac{f_{\pi}}{4} \left\{ \langle D_{\mu} U^{\dagger} D^{\mu} U \rangle + r \langle m (U + U^{\dagger}) \rangle - \frac{r}{\Lambda_{\chi}^{2}} \langle m (D^{2} U + D^{2} U^{\dagger}) \rangle \right\}$$

- QCD at low energies is  $\chi$ PT, therefore any QCD inspired model has to obtain compatible predictions with  $\chi$ PT.
- Inconsistencies of BBG Lagrangian:
  - $\mathcal{O}(p^2)$  equivalent to  $\chi \text{PT}$ .
  - $\mathcal{O}(p^4)$  just  $L_5$  term  $(L_i = 0, i \neq 5)$ 
    - $(2L_8 L_5)^{\infty} = -\frac{1}{4}L_5^{\infty} \longrightarrow \varepsilon'/\varepsilon$  depends strongly on  $L_5!$
  - $\mathcal{O}(p^6)$  put to zero!

**When the set of the s** 

$$B_{6}^{(1/2)} = 1 - \frac{3}{2} \left[ \frac{F_{\pi}}{F_{K} - F_{\pi}} \right] \frac{(m_{K}^{2} - m_{\pi}^{2})}{(4\pi F_{\pi})^{2}} \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{6}^{2}} \right) = 1 - 0.66 \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{6}^{2}} \right)$$

$$B_{8}^{(1/2)} = 1 + \frac{(m_{K}^{2} - m_{\pi}^{2})}{(4\pi F_{\pi})^{2}} \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right) = 1 + 0.08 \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right)$$

$$B_{8}^{(3/2)} = 1 - 2 \frac{(m_{K}^{2} - m_{\pi}^{2})}{(4\pi F_{\pi})^{2}} \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right) = 1 - 0.17 \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right)$$

$$B_{8}^{(1/2)} \leq B_{6}^{(1/2)} < 1$$

- HME = Large  $N_C$  estimation + some dispersive corrections.
- Missing  $L_i$ ,  $i \neq 5$  corrections!
- Missing large absorptive corrections of order  $O(1/N_C)$
- $Abs(A_I) = 0 \longrightarrow \delta_I = 0, \forall I \text{ (Not in QCD!)}$

**When the set of the s** 

$$B_{6}^{(1/2)} = 1 - \frac{3}{2} \left[ \frac{F_{\pi}}{F_{K} - F_{\pi}} \right] \frac{(m_{K}^{2} - m_{\pi}^{2})}{(4\pi F_{\pi})^{2}} \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{6}^{2}} \right) = 1 - 0.66 \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{6}^{2}} \right)$$

$$B_{8}^{(1/2)} = 1 + \frac{(m_{K}^{2} - m_{\pi}^{2})}{(4\pi F_{\pi})^{2}} \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right) = 1 + 0.08 \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right)$$

$$B_{8}^{(3/2)} = 1 - 2 \frac{(m_{K}^{2} - m_{\pi}^{2})}{(4\pi F_{\pi})^{2}} \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right) = 1 - 0.17 \ln \left( 1 + \frac{\Lambda^{2}}{\tilde{m}_{8}^{2}} \right)$$

$$B_{6}^{(1/2)} = B_{6}^{(1/2)} < 1 \longrightarrow \text{Not true in QCD!}$$

- HME = Large  $N_C$  estimation + some dispersive corrections.
- Missing  $L_i$   $i \neq 5$  corrections!
- Missing large absorptive corrections of order  $O(1/N_C)$
- $Abs(A_I) = 0 \longrightarrow \delta_I = 0, \forall I \text{ (Not in QCD!)}$

### Absortive contributions in $\chi PT$

Absorptive contribution fully originated by this diagram, since it is the only one where the two intermediate pions can be put on their mass-shell.

$$\Delta_{L} \mathcal{A}_{1/2}^{(X)} = \frac{M_{K}^{2}}{(4\pi F_{\pi})^{2}} \left(1 - \frac{M_{\pi}^{2}}{2M_{K}^{2}}\right) \widetilde{B}(M_{\pi}^{2}, M_{\pi}^{2}, M_{K}^{2}) + \cdots,$$
  
$$\Delta_{L} \mathcal{A}_{3/2}^{(X)} = -\frac{1}{2} \frac{M_{K}^{2}}{(4\pi F_{\pi})^{2}} \left(1 - \frac{2M_{\pi}^{2}}{M_{K}^{2}}\right) \widetilde{B}(M_{\pi}^{2}, M_{\pi}^{2}, M_{K}^{2}) + \cdots,$$

where

$$\widetilde{B}(M_\pi^2,M_\pi^2,M_K^2) \,=\, \sigma_\pi \, \left[\log\left(rac{1-\sigma_\pi}{1+\sigma_\pi}
ight) + i\pi
ight] + \log\left(rac{
u_\chi^2}{M_\pi^2}
ight) + 1, \quad \sigma_\pi \equiv \sqrt{1-4M_\pi^2/M_K^2}.$$

## LO $\chi \text{PT}$ values for the strong $\pi\pi$ scattering phase shift

For J = 0 and I = 0, 2, at  $s = M_K^2$ :

$$an \delta_0(M_K^2) = \frac{\sigma_\pi}{32\pi F_\pi^2} \left( 2M_K^2 - M_\pi^2 \right) , \qquad an \delta_2(M_K^2) = \frac{\sigma_\pi}{32\pi F_\pi^2} \left( 2M_\pi^2 - M_K^2 \right) .$$

The predicted phase-shift difference,  $\delta_0(M_K^2) - \delta_2(M_K^2) = 37^\circ$ , is somewhat lower than its experimental value showing that higher-order rescattering contributions are numerically relevant. The one-loop integral  $\widetilde{B}(M_{\pi}^2, M_{\pi}^2, M_{K}^2)$  contains a large chiral logarithm of the ultraviolet scale  $\nu_{\chi}$  over the infrared scale  $M_{\pi}$ , which enhances the dispersive component of the I = 0 amplitude and suppresses the I = 2 one.
