Radioactive Isotopes

- Why do we use radioactive ion beams?
 - How are radioactive ion beams produced?
 - production mechanisms
 - Isotope Separator On-Line versus In-Flight
 - ISOLDE – CERN
 - Laser Resonance Ionization
 - Basic principle
 - What can we learn from it?
 - Properties and limitations: selectivity, spectral broadening
 - Selected examples of laser spectroscopy studies
 - Conclusion and outlook
- 

Production of Radioactive Isotopes

- **Primary nuclear reaction:**

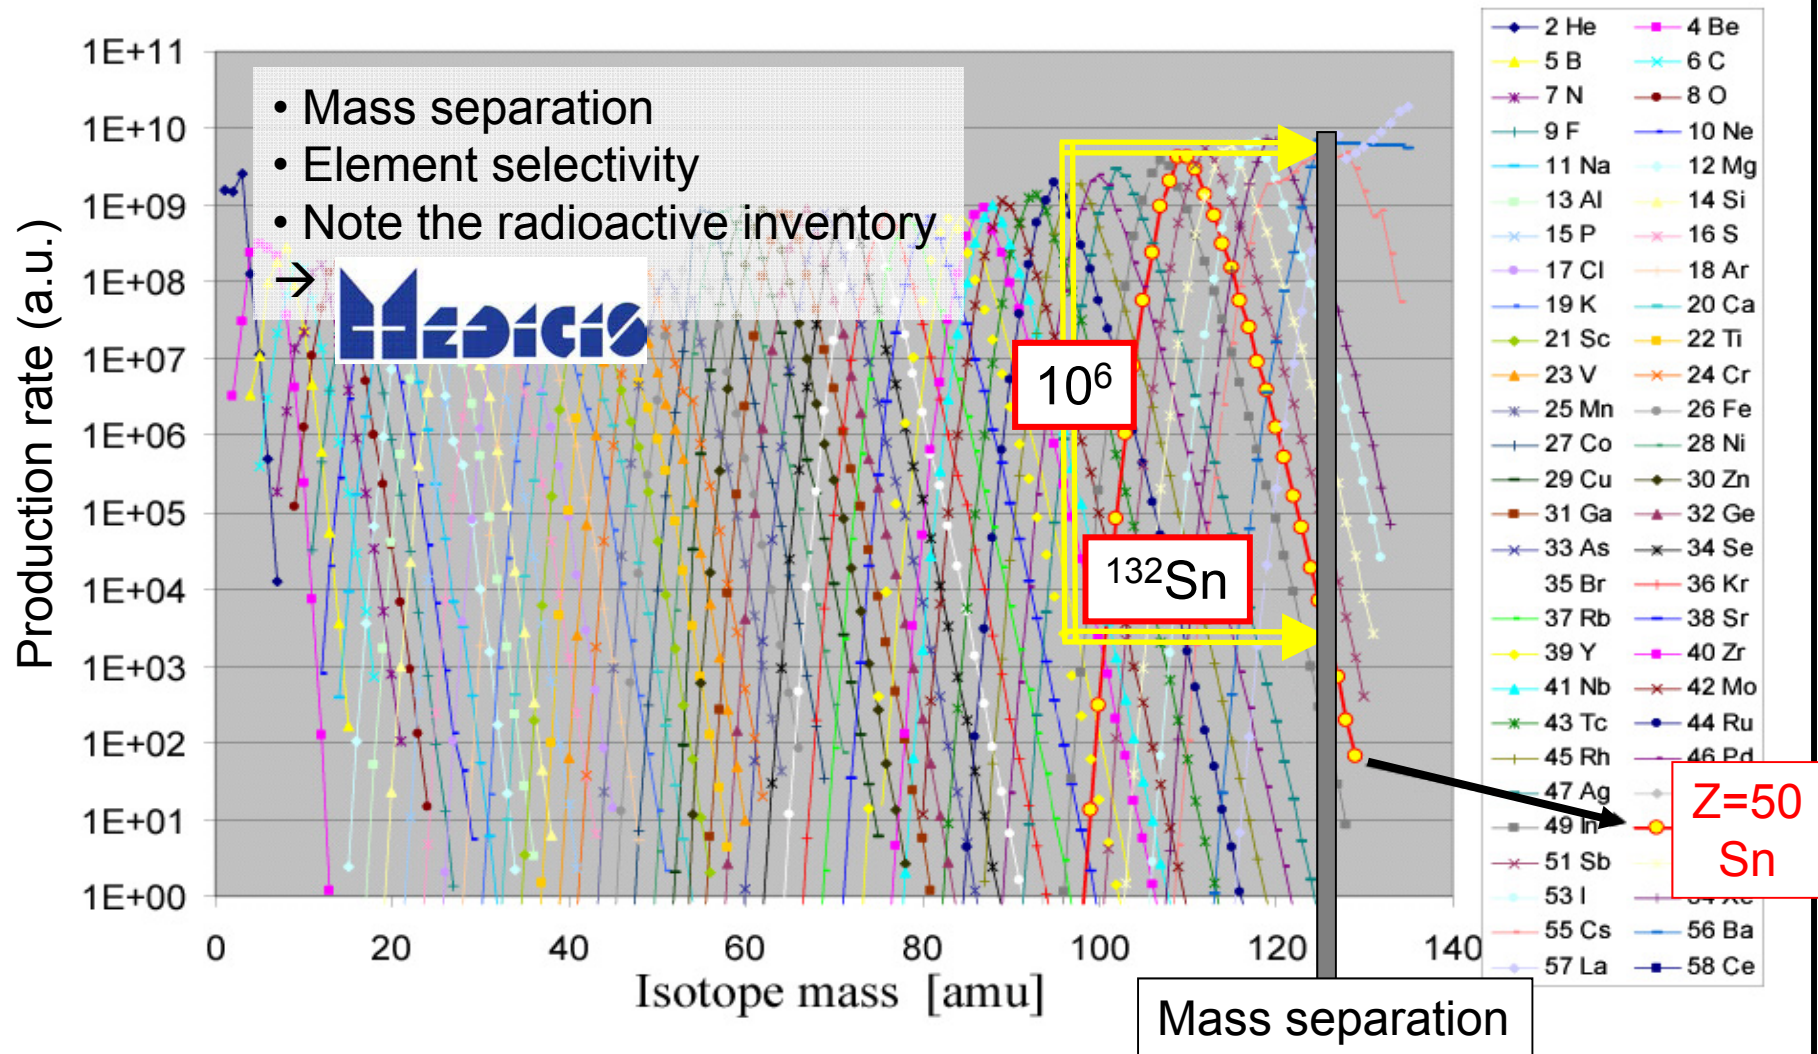

- fragmentation: high energy protons or heavy ions
- fission: proton, neutron and photon induced
- spallation: high energy protons
- fusion: heavy- and light ion induced

⇒ targets and beams available to produce many isotopes (not all!)

Production of PURE Radioactive Ion Beams

- 1 GeV proton beam on a lanthanum (La) target

- Radioactive Ion Beams are produced using two complementary ways
 - Isotope Separator On Line method (ISOL)
 - In-flight method

See lecture: "Ion sources for radioactive beams", Fredrik Wenander (MEDICIS-Promed Summer School, Pavia, 4-9 June 2017)

See lecture: "Target material for radioisotope production" J. Pedro Ramos

Experimental RIB research

↑
Energy

- HIE ISOLDE

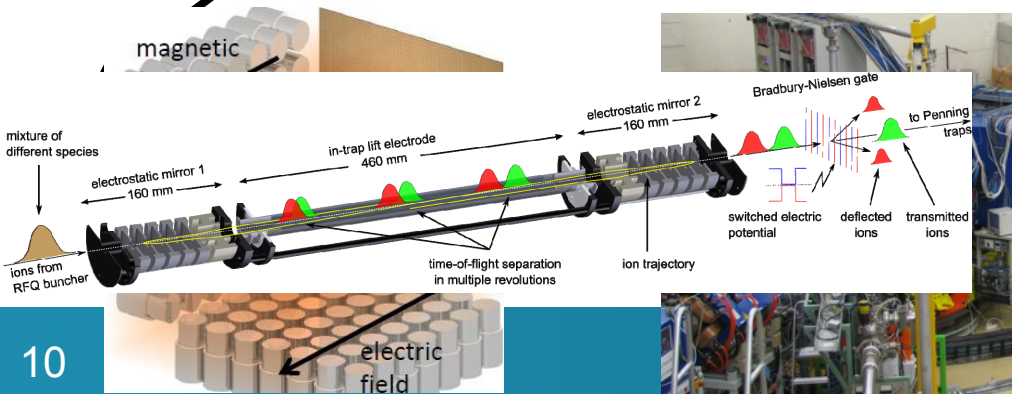

- Primary beam
- Production cross section
- **Efficiency**

→ Intensity

- **Beam purification**
(**laser ion source**, MR-TOF, High Resolution Separator)
- **Adapted instrumentation**
(see lecture "Radioactive Ion Beam Manipulation" P. Delahaye
(identification of reaction products,
detection of weak signals))

Laser Resonance Ionization

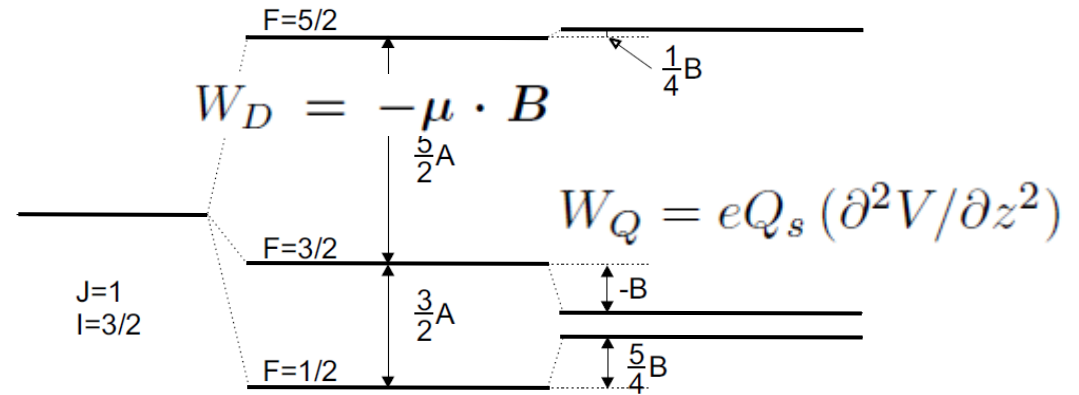

Otten E.W., Treatise on Heavy Ion Science vol 8 (1989) 517
 Billowes J and Campbell P, J. Phys. G21 (1995) 707
 Kluge H-J., Nörtershäuser, W. Spectrochim. Acta B 58 (2003) 1031
 Kluge H-J., Hyperfine Interact. 196 (2010) 295
 Cheal B. and Flanagan K., J. Phys. G. 37 (2010) 113101

- saturation: $\sim 10 \text{ mW/cm}^2 \sim 10^{16} \text{ photons/s cm}^2$

- Laser Spectroscopy: basics

Hyperfine Splitting

$$W_F = \frac{1}{2}AC + B \frac{\frac{3}{4}C(C+1) - I(I+1)J(J+1)}{2I(2I-1)J(2J-1)}$$

$$C = F(F+1) - I(I+1) - J(J+1).$$

$$\vec{F} = \vec{I} + \vec{J} \quad (|I-J| \leq F \leq I+J)$$

$$A = \mu_I B_e(0) / (IJ)$$

$$B = eQ_s V_{ZZ}(0)$$

- Laser Spectroscopy: basics

Isotope Shift

$$\delta\nu_{IS}^{AA'} = K_{MS} \cdot \frac{M_{A'} - M_A}{M_A M_{A'}} + \frac{2\pi Z e}{3} \Delta |\Psi(0)|^2 \delta \langle r^2 \rangle^{AA'}$$

Mass shift
(center of mass motion)

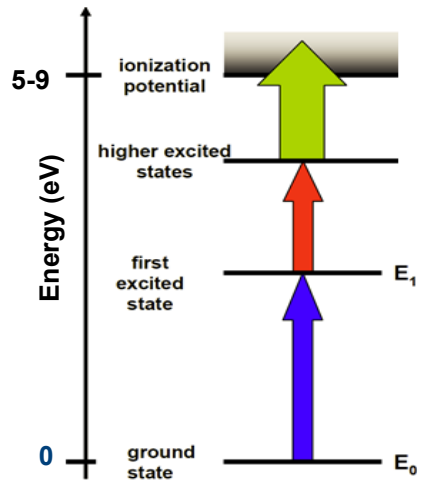

Field shift
(finite size)

Blaum, Dilling, Nörtershäuser
Phys. Scr. T152 (2013)

Laser Spectroscopy Experiments: requirements

- High spectral resolution
- High accuracy
- High efficiency/sensitivity (weak production)
- Fast measurement cycle (short-lived radioactive isotopes)

Measured: Isotope shifts Isomer shifts Hyperfine splitting

Deduced observables:
(nuclear-model independent)

Atomic Theory

Sizes Quadrupole Mom. Dipole Mom. Spins / Parities

Inferred information:
(nuclear-model dependent)

Static/dynamic deformation Single-particle configurations

Chart of Nuclei - Laser Spectroscopy of exotic nuclei

Progress is driven by innovative developments of instrumentation

Broadening mechanisms of the spectral lines

- Natural line width $\delta\nu_n = 1/(2\pi\tau)$ τ : life time of atomic state

- Doppler width – thermal movement: $\delta\nu_D = \frac{\nu_0}{c} \sqrt{8kT \ln 2/m}$

T: temperature (K)

m: mass of the atom

k: Boltzmann's constant

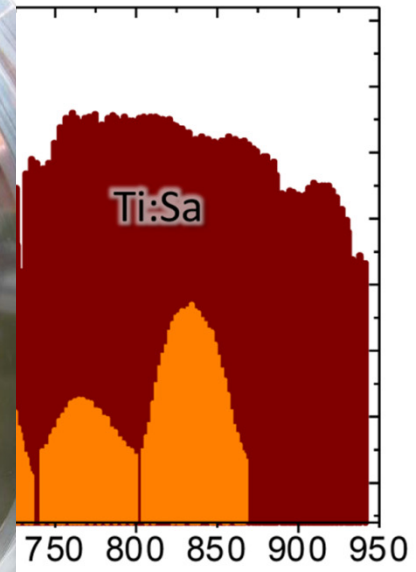

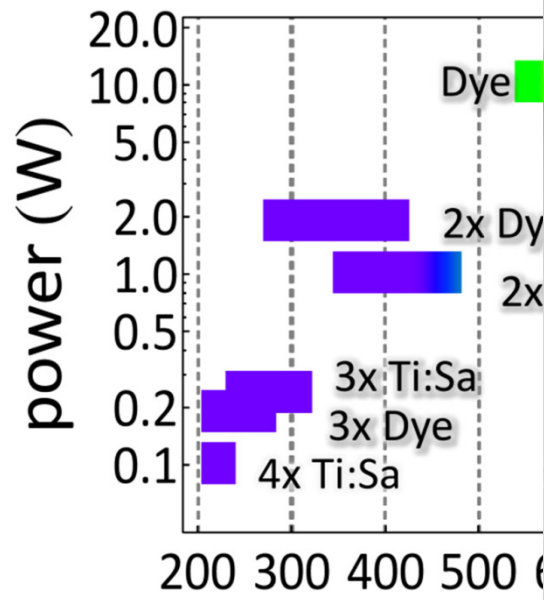

c: velocity of light

- Laser line width

Duty cycle problem:
 transport time (hot cavity) $\sim 100 \mu\text{s}$
 \rightarrow Laser beams:
 Nd:YAG (10 kHz) pumped dye
 lasers and Ti:Sa lasers

- Laser Ionization of Astatine (At)

Received 21 Aug 2012 | Accepted 27 Mar 2013 | Published 14 May 2013

DOI: 10.1038/ncomms2819

OPEN

Measurement of the first ionization potential of astatine by laser ionization spectroscopy

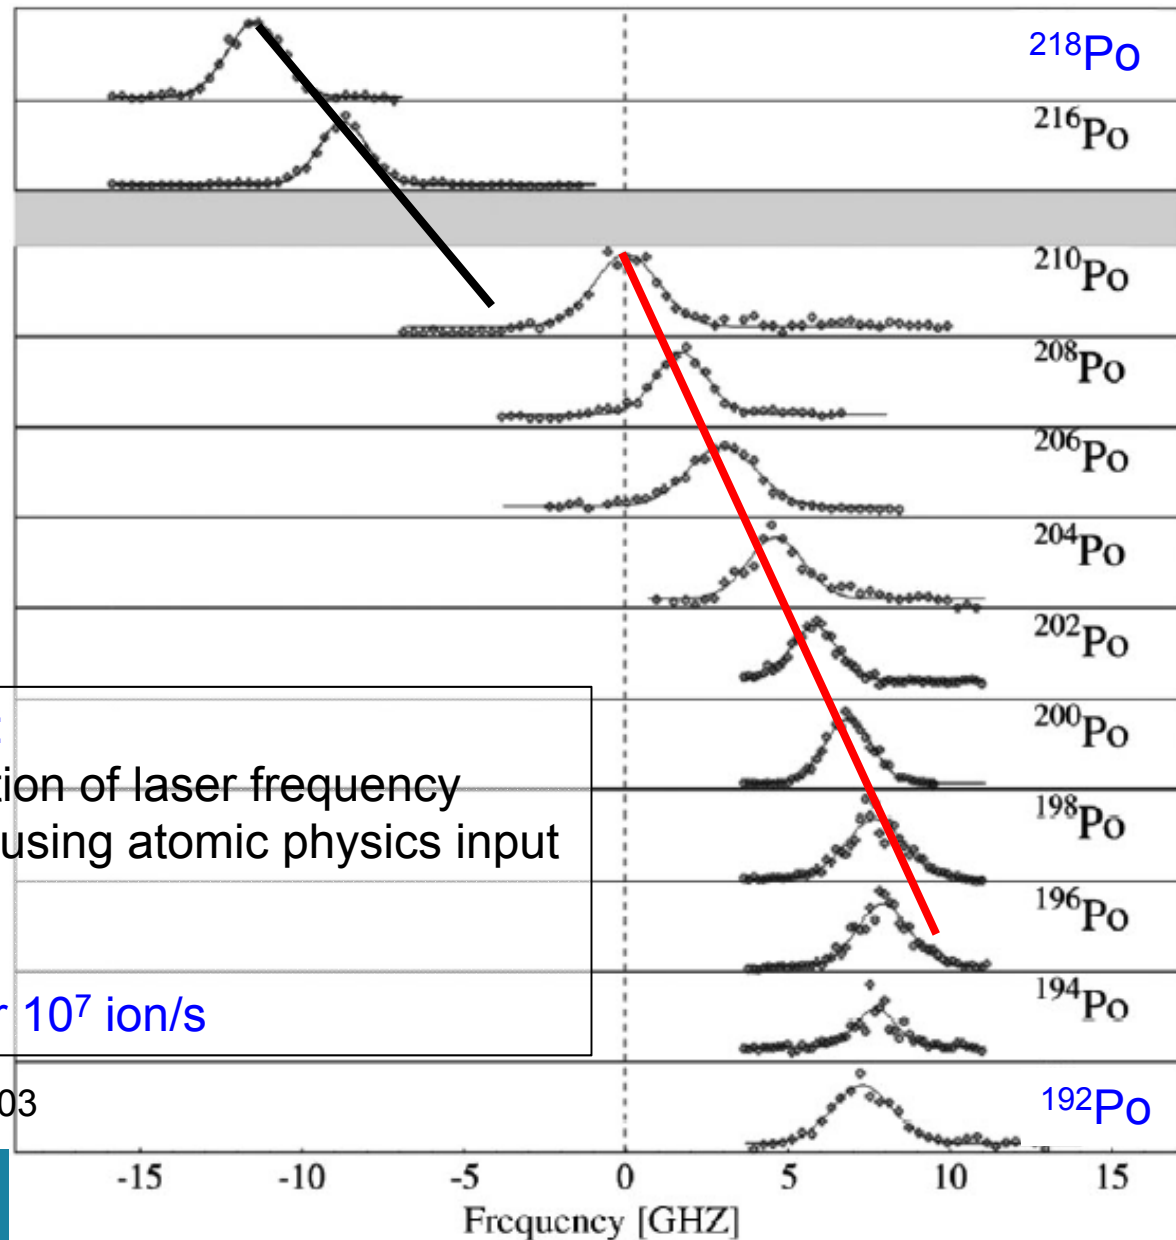

The Ionization Scheme of Astatine

- ISOLDE (CERN) and TRIUMF (Canada)
- $IP(\text{At}) = 9.31751(8) \text{ eV}$
- Atomic theory
 - MCDF: 9.24 (15) eV (Fritzsche)
 - CCSD: 9.307 (25) eV (Pershina)
- Benchmark for the prediction of the chemical properties of astatine e.g. ^{211}At for targeted alpha-particle therapy

- Laser spectroscopy of Po

- In-source laser spectroscopy :
 - production rate as a function of laser frequency
 - deduction of charge radii using atomic physics input
- A=218 to 192
- $T_{1/2} = 3 \text{ yr to } 33 \text{ ms}$
- Intensity from 0.3 ion/s to over 10^7 ion/s

Th. Cocolios et al., PRL106 (2011) 052503

Shape Coexistence in the Lead Region

preliminary

Potential energy surface of ^{186}Pb ($Z=82, N=104$)

- Reducing the spectral line width

- Narrow-band laser light
- Lower temperature (e.g. super sonic gas jets)
- Atom/ion beam co-linear with laser light

- Velocity after acceleration: $v = \sqrt{2eU/m}$

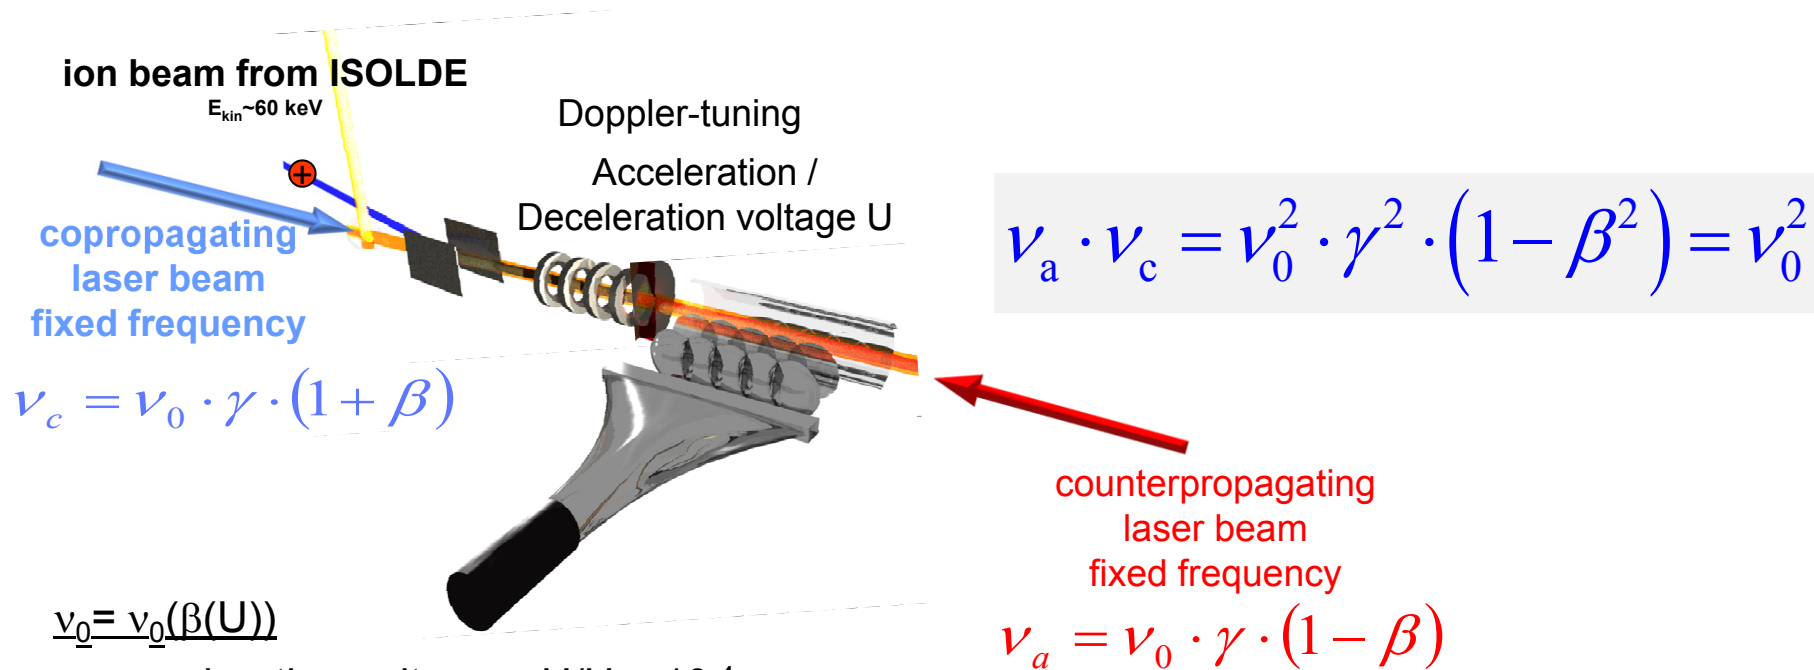

- Spread in energy: $\delta E = \delta \left(\frac{1}{2} m v^2 \right) = m v \delta v$

- Doppler shift: $\Delta \nu_D = \nu_0 \beta = \nu_0 (v/c)$

- Doppler broadening: $\delta \nu_D = \nu_0 \delta \beta = \nu_0 (\delta v/c)$

$$\delta \nu_D = \nu_0 \frac{\delta E}{\sqrt{2eU m c^2}}$$

- Halo Nuclei - Laser Spectroscopy of Short-Lived Be isotopes: Copropagating and Counterpropagating Laser Beams.

$$\underline{\nu_0 = \nu_0(\beta(U))}$$

- acceleration voltage $\Delta U/U = 10^{-4}$

Requirements:

- Measure absolute frequencies: Accuracy: $\Delta\nu/\nu < 10^{-9}$
- High sensitivity: 8000 ions per second $^{12}\text{Be}(T_{1/2} = 21\text{ms})$

Conclusion and Outlook

- **Lasers** are an important tool for **Radioactive Beam** studies:
 - for the production of pure (isomeric) beams (> 50% beam time at ISOLDE)
 - for fundamental research (nuclear physics, atomic physics, nuclear astrophysics, condensed matter, fundamental interaction studies...)
 - for applications (trace analysis, future medical radioisotope production)
- **Substantial progress** has been made on different fronts:
 - laser developments (necessary power, stability, ruggedized, towards turn-key systems)
 - implementation of laser ionization (hot cavity, gas jet, CRIS, LIST-Fink,- PRX5 (2015))
- **Worldwide efforts for production of RIB**
 - facilities under construction and major upgrades

- Radioactive Ion Beams Factories
