## **Status and prospects of neutrino mass hierarchy and CP-violation measurements**

*Monday 11 June 2018 10:00 (30 minutes)*

With the discovery of the 3rd neutrino mixing angle,  $\theta_{13}$ , in 2012 a door was opened to answer the remaining unknowns in neutrino oscillations: the mass hierarchy, whether  $\theta_{23}$  is larger/smaller or exactly 45 degrees, and whether CP symmetry is violated. Several experiments have exciting new data and are exploring this landscape. I will review the current results and consider the prospects for the future.
