Review on high energy neutrino measurements

Monday, 11 June 2018 14:00 (30 minutes)

High-energy neutrinos are an important messenger particle to understand the high-energy universe. In 2013, the IceCube Neutrino Observatory has reported the first observation of a flux of high-energy astrophysical neutrinos with energies reaching above PeV. However, the sources of these neutrinos remain a puzzle. Since then, these measurements have been refined and the observation has been confirmed with independent data sets. This talk will give an overview of the observations with a focus on the most recent results and gives an outlook to the future.
