Discrete Symmetries, Neutrino Mixing and Leptonic CP Violation

S. T. Petcov
SISSA/INFN, Trieste, Italy, and Kavli IPMU, University of Tokyo, Japan

7th Symposium on Symmetries in Subatomic Physics (SSP 2018)
RWTH Aachen University
Aachen, Germany
June 11, 2018
Understanding the origin of the pattern of neutrino mixing and of neutrino mass squared differences that emerged from the neutrino oscillation data in the recent years is one of the most challenging problems in neutrino physics. It is part of the more general fundamental problem in particle physics of understanding the origins of flavour in the quark and lepton sectors, i.e., of the patterns of quark masses and mixing, and of the charged lepton and neutrino masses and of neutrino mixing.
Of fundamental importance are also

- the determination of the status of lepton charge conservation and the nature - Dirac or Majorana - of massive neutrinos (which is one of the most challenging and pressing problems in present day elementary particle physics) (GERDA, CUORE, KamLAND-Zen, EXO, LEGEND, nEXO,...);

- determining the status of CP symmetry in the lepton sector (T2K, NO\(\nu\)A; T2HK, DUNE);

- determination of the type of spectrum neutrino masses possess, or neutrino mass ordering (T2K + NO\(\nu\)A; JUNO; PINGU, ORCA; T2HKK, DUNE);

- determination of the absolute neutrino mass scale, or \(\min(m_j)\) (KATRIN, new ideas; cosmology).

The program of research extends beyond 2030.

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
All compelling data compatible with 3-ν mixing:

\[ \nu_{lL} = \sum_{j=1}^{3} U_{lj} \nu_{jL} \quad l = e, \mu, \tau. \]

The PMNS matrix $U$ - 3 × 3 unitary to a good approximation (at least: $|U_{l,n}| \lesssim (\ll) 0.1$, $l = e, \mu$, $n = 4, 5, ...$).

$\nu_j$, $m_j \neq 0$: Dirac or Majorana particles.

3-ν mixing: 3-flavour neutrino oscillations possible.

$\nu_\mu$, $E$; at distance $L$: $P(\nu_\mu \to \nu_\tau(e)) \neq 0$, $P(\nu_\mu \to \nu_\mu) < 1$

$P(\nu_l \to \nu_{l'}) = P(\nu_l \to \nu_{l'}; E, L; U; m_2^2 - m_1^2, m_3^2 - m_1^2)$
Three Neutrino Mixing

\[ \nu_{lL} = \sum_{j=1}^{3} U_{lj} \nu_{jL} . \]

\( U \) is the Pontecorvo-Maki-Nakagawa-Sakata (PMNS) neutrino mixing matrix,

\[
U = \begin{pmatrix}
U_{e1} & U_{e2} & U_{e3} \\
U_{\mu1} & U_{\mu2} & U_{\mu3} \\
U_{\tau1} & U_{\tau2} & U_{\tau3}
\end{pmatrix}
\]

- \( U \) - \( n \times n \) unitary:

\[
\begin{array}{cccc}
n & 2 & 3 & 4 \\
n(\frac{1}{2}n(n-1)) & 1 & 3 & 6
\end{array}
\]

mixing angles: \( n = 3 \):

\[
\begin{array}{cccc}
1 \text{ Dirac and} & \frac{1}{2}(n-1)(n-2) & 0 & 1 & 3 \\
2 \text{ additional CP-violating phases, Majorana phases}
\end{array}
\]

S.M. Bilenky, J. Hosek, S.T.P., 1980
\[ U = V P, \quad P = \begin{pmatrix} 1 & 0 & 0 \\ 0 & e^{\frac{i\alpha_{21}}{2}} & 0 \\ 0 & 0 & e^{\frac{i\alpha_{31}}{2}} \end{pmatrix}, \]

\[ V = \begin{pmatrix} c_{12}c_{13} & s_{12}c_{13} & s_{13}e^{-i\delta} \\ -s_{12}c_{23} - c_{12}s_{23}s_{13}e^{i\delta} & c_{12}c_{23} - s_{12}s_{23}s_{13}e^{i\delta} & s_{23}c_{13} \\ s_{12}s_{23} - c_{12}c_{23}s_{13}e^{i\delta} & -c_{12}s_{23} - s_{12}c_{23}s_{13}e^{i\delta} & c_{23}c_{13} \end{pmatrix} \]

- \( s_{ij} \equiv \sin \theta_{ij}, \ c_{ij} \equiv \cos \theta_{ij}, \ \theta_{ij} = [0, \frac{\pi}{2}] \)
- \( \delta - \) Dirac CPV phase, \( \delta = [0, 2\pi] \); CP inv.: \( \delta = 0, \pi, 2\pi \)
- \( \alpha_{21}, \alpha_{31} - \) Majorana CPV phases; CP inv.: \( \alpha_{21(31)} = k(k')\pi, \ k(k') = 0, 1, 2... \)
- \( \Delta m_{\odot}^2 \equiv \Delta m_{21}^2 \cong 7.37 \times 10^{-5} \text{ eV}^2 > 0, \ \sin^2 \theta_{12} \cong 0.297, \ \cos 2\theta_{12} \gtrsim 0.29 (3\sigma) \)
- \( |\Delta m_{31(32)}^2| \cong 2.53 (2.43) [2.56 (2.54)] \times 10^{-3} \text{ eV}^2, \ \sin^2 \theta_{23} \cong 0.437 (0.569) [0.425 (0.589)], \ \text{NO (IO)} \),
- \( \theta_{13} - \) the CHOOZ angle: \( \sin^2 \theta_{13} = 0.0214 (0.0218) [0.0215 (0.0216)], \ \text{NO (IO)} \)

NuFit 3.2 (2018)

- data available till Jan 2018
- latest T2K data as of Aug 2017
- NOvA 8.85e20 pot disapp and appearance data, Jan 2018

The Quest for Nature’s Message
With the observed pattern of neutrino mixing Nature is sending us a message. The message is encoded in the values of the neutrino mixing angles, leptonic CP violation phases and neutrino masses. The message can have two completely different contents: it can read

ANARCHY or SYMMETRY.

ANARCHY:

Understanding the Pattern of Neutrino Mixing:
Symmetry Approach.
Examples of Predictions and Correlations.

- \( \sin^2 \theta_{23} = \frac{1}{2} \).
- \( \sin^2 \theta_{23} \approx \frac{1}{2} (1 \mp \sin^2 \theta_{13}) + O(\sin^4 \theta_{13}) \approx \frac{1}{2} (1 \mp 0.022) \).
- \( \sin^2 \theta_{23} = 0.455; 0.463; 0.537; 0.545; 0.604 \) (small uncertain).
- \( \sin^2 \theta_{12} \approx \frac{1}{3} (1 + \sin^2 \theta_{13}) + O(\sin^4 \theta_{13}) \approx 0.340 \).
- \( \sin^2 \theta_{12} \approx \frac{1}{3} (1 - 2 \sin^2 \theta_{13}) + O(\sin^4 \theta_{13}) \approx 0.319 \).
- and/or \( \cos \delta = \cos \delta(\theta_{12}, \theta_{23}, \theta_{13}; \theta_{12}^\nu, ...) \),
- \( J_{CP} = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}, \delta) = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}; \theta_{12}^\nu, ...) \),
- \( \theta_{12}^\nu, \ldots \) - known (fixed) parameters, depend on the underlying symmetry.
The measurement of the Dirac phase in the PMNS mixing matrix, together with an improvement of the precision on the mixing angles $\theta_{12}$, $\theta_{13}$ and $\theta_{23}$, can provide unique information about the possible existence of new fundamental symmetry in the lepton sector.
Understanding the Pattern of Neutrino Mixing:
Predictions for the CPV Phase $\delta$. 
Neutrino Mixing: New Symmetry?

• \( \theta_{12} = \theta_{\odot} \simeq \frac{\pi}{5.4}, \quad \theta_{23} = \theta_{\text{atm}} \simeq \frac{\pi}{4}(?), \quad \theta_{13} \simeq \frac{\pi}{20} \)

\[
U_{\text{PMNS}} \simeq \begin{pmatrix}
\sqrt{\frac{2}{3}} & \sqrt{\frac{1}{3}} & \epsilon \\
-\sqrt{\frac{1}{6}} & \sqrt{\frac{1}{3}} & -\sqrt{\frac{1}{2}} (?) \\
-\sqrt{\frac{1}{6}} & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{2}} (?) \\
\end{pmatrix};
\]

Very different from the CKM-matrix!

• \( \theta_{12} \simeq \sin^{-1} \frac{1}{\sqrt{3}} - 0.020; \quad \theta_{12} \simeq \pi/4 - 0.20, \quad \theta_{13} \simeq 0 + \pi/20, \quad \theta_{23} \simeq \pi/4 \pm 0.10. \)

• \( U_{\text{PMNS}} \) due to new approximate symmetry?

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
A Natural Possibility (vast literature):

\[ U = U^\dagger_{\text{lep}}(\theta^\ell_{ij}, \delta^\ell) \, Q(\psi, \omega) U_{\text{TBM,BM,LC},...} \, \bar{P}(\xi_1, \xi_2), \]

with

\[ U_{\text{TBM}} = \begin{pmatrix} \sqrt{\frac{2}{3}} & \sqrt{\frac{1}{3}} & 0 \\ -\sqrt{\frac{1}{6}} & \sqrt{\frac{1}{3}} & -\sqrt{\frac{1}{2}} \\ -\sqrt{\frac{1}{6}} & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{2}} \end{pmatrix} \quad \text{and} \quad U_{\text{BM}} = \begin{pmatrix} \frac{1}{\sqrt{2}} & \pm \frac{1}{\sqrt{2}} & 0 \\ -\frac{1}{2} & \pm \frac{1}{2} & \frac{1}{\sqrt{2}} \\ \frac{1}{2} & \mp \frac{1}{2} & \frac{1}{\sqrt{2}} \end{pmatrix}. \]

- \( U^\dagger_{\text{lep}}(\theta^\ell_{ij}, \delta^\ell) \) - from diagonalization of the \( l^- \) mass matrix;

- \( U_{\text{TBM,BM,LC},...} \, \bar{P}(\xi_1, \xi_2) \) - from diagonalization of the \( \nu \) mass matrix;

- \( Q(\psi, \omega) \), - from diagonalization of the \( l^- \) and/or \( \nu \) mass matrices.

P. Frampton, STP, W. Rodejohann, 2003

---

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
$U_L$, $U_{GRAM}$, $U_{GRBM}$, $U_{HGM}$:

$U_L = \begin{pmatrix}
\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\
-c_{23} & c_{23} & \sqrt{2} s_{23} \\
-s_{23} & -s_{23} & c_{23}
\end{pmatrix}$; $\mu - \tau$ symmetry: $\theta_{23}^{\nu} = \mp \pi/4$;

$U_{GR} = \begin{pmatrix}
c_{12}^{\nu} & s_{12}^{\nu} & 0 \\
-s_{12}^{\nu} & c_{12}^{\nu} & \sqrt{1/2} \\
-s_{12}^{\nu} & c_{12}^{\nu} & \sqrt{1/2}
\end{pmatrix}$; $U_{HGM} = \begin{pmatrix}
\frac{\sqrt{3}}{2} & \frac{1}{2} & 0 \\
-\frac{1}{2\sqrt{2}} & \frac{\sqrt{3}}{2\sqrt{2}} & -\frac{1}{\sqrt{2}} \\
-\frac{1}{2\sqrt{2}} & \frac{\sqrt{3}}{2\sqrt{2}} & \frac{1}{\sqrt{2}}
\end{pmatrix}$, $\theta_{12}^{\nu} = \pi/6$.

$U_{GRAM}$: $\sin^2 \theta_{12}^{\nu} = (2 + r)^{-1} \approx 0.276$, $r = (1 + \sqrt{5})/2$

($GR$: $r/1$; $a/b = a + b/a$, $a > b$)

$U_{GRBM}$: $\sin^2 \theta_{12}^{\nu} = (3 - r)/4 \approx 0.345$.

GRB and HG mixing: W. Rodejohann et al., 2009.
• $U_{TBM}$: $s_{12}^2 = 1/3, s_{23}^2 = 1/2, s_{13}^2 = 0$; $s_{13}^2 = 0$ must be corrected; if $\theta_{23} \neq \pi/4$, $s_{23}^2 = 0.5$ must be corrected.

• $U_{BM}$: $s_{12}^2 = 1/2, s_{23}^2 = 1/2, s_{13}^2 = 0$; $s_{13}^2 = 0$, $s_{12}^2 = 1/2$ and possibly $s_{23}^2 = 1/2$ must be corrected.

$U_{TBM(BM)}$: Groups $S_4, A_4, T' (S_4), ...$ (vast literature)

• $U_{GRA}$: Group $A_5,...$; $s_{13}^2 = 0$ and possibly $s_{12}^2 = 0.276$ and $s_{23}^2 = 1/2$ must be corrected.

L. Everett, A. Stuart, arXiv:0812.1057;...

• $U_{LC}$: alternatively $U(1)$, $L' = L_e - L_\mu - L_\tau$

S.T.P., 1982

• $U_{LC}$: $s_{12}^2 = 1/2, s_{13}^2 = 0, s_\nu^{23}$ - free parameter; $s_{13}^2 = 0$ and $s_{12}^2 = 1/2$ must be corrected.
• $U_{GRB}$: Group $D_{10}, \ldots$; $s_{13}^2 = 0$ and possibly $s_{12}^2 = 0.345$ and $s_{23}^2 = 1/2$ must be corrected.

• $U_{HG}$: Group $D_{12}, \ldots$; $s_{13}^2 = 0$, $s_{12}^2 = 0.25$ and possibly $s_{23}^2 = 1/2$ must be corrected.

For all symmetry forms considered we have: $\theta_{\nu 13} = 0$, $\theta_{\nu 23} = \mp \pi/4$.
They differ by the value of $\theta_{\nu 12}$:
TBM, BM, GRA, GRB and HG forms correspond to $\sin^2 \theta_{\nu 12} = 1/3; 0.5; 0.276; 0.345; 0.25$.

Number of elements, generators and irreducible representations of some discrete groups.
$G_f$: non-Abelian discrete (finite) flavour symmetry.

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
Typically (but not uniquely) $l_L(x), \nu_{lL}(x), \ l = e, \mu, \tau$ - triplets of $G_f$.

$G_\nu$— symmetry of the neutrino mass term;

$G_e$— symmetry of the charged lepton mass term.

**Majorana Mass Term for $\nu_{lL}(x), \ l = e, \mu, \tau$:**

$$L_M^\nu(x) = \frac{1}{2} \nu_L^T(x) C^{-1} M_{\nu l} \nu_L(x) + h.c., \ C^{-1} \gamma_\alpha C = -\gamma_\alpha^T$$

**Charged lepton mass term:**

$$L_\ell(x) = -\overline{l_L}(x) M_{e\ell} l_R(x) + h.c.$$
\[ U_e: \quad U_e^\dagger M_e M_e^\dagger U_e = \text{diag}(m_e^2, m_\mu^2, m_\tau^2). \]

\( G_e \) - residual symmetry group of \( M_e M_e^\dagger \)

\[ U_\nu: \quad U_\nu^T M_\nu U_\nu = \text{diag}(m_1, m_2, m_3). \]

\( G_\nu \) - residual symmetry group of \( M_\nu \)

\[ U_{PMNS} = U_e^\dagger U_\nu \]

\( G_e = Z_2; \ Z_n, \ n > 2; \ Z_n \times Z_m, \ n, m \geq 2 \)

(max. \( G_e = U(1) \times U(1) \times U(1) + G_e \) subgroup of \( SU(3) \): max. \( G_e = U(1) \times U(1) \))

\( \nu_j \), Majorana mass term, \( m_j \neq m_k, \ j \neq k = 1, 2, 3: \)

\( G_\nu = Z_2 \times Z_2, \ Z_2 \)

(max. \( G_\nu = Z_2 \times Z_2 \times Z_2 + G_\nu \) subgroup of \( SU(3) \): max. \( G_\nu = Z_2 \times Z_2 \))
\( \rho: \) the unitary irrep. of \( G_f \) acting on \( l_L(x) \):
\[
l_L(x) \to \rho(g_f) l_L(x), \quad g_f \in G_f; 
\]
\( g_e: \) an element of residual symmetry \( G_e \);
\( \rho(g_e): \) action of \( G_e \) on \( l_L(x), \quad l = e, \mu, \tau: \)
\[
l_L(x) \to \rho(g_e) l_L(x). 
\]

\( G_e - \) residual symmetry group of \( M_e M_e^\dagger: \)
\[
\rho(g_e) M_e M_e^\dagger \rho(g_e) = M_e M_e^\dagger, 
\]
\( \rho(g_e) \) and \( M_e M_e^\dagger \) commute: both are diagonalised by \( U_e. \)
\( \rho(g_e) - \) known: \( U_e \) constrained or determined.
\( \rho \): the unitary irrep. of \( G_f \) acting on \( \nu_L(x) \):
\[ \nu_L(x) \rightarrow \rho(g_f) \nu_L(x), \ g_f \in G_f; \]
\( g_\nu \): an element of residual symmetry \( G_\nu \);
\( \rho(g_\nu) \): action of \( G_\nu \) on \( \nu_L(x) \), \( l = e, \mu, \tau \):
\[ \nu_L(x) \rightarrow \rho(g_\nu) \nu_L(x). \]

\( M_\nu \) - neutrino Majorana mass matrix.
\( U_\nu \): \( U_\nu^T M_\nu U_\nu = \text{diag}(m_1, m_2, m_3) \).

\( G_\nu \) - residual symmetry group of \( M_\nu \):
\[ \rho(g_\nu)^T M_\nu \rho(g_\nu) = M_\nu, \]

\( \rho(g_\nu) \) and \( M_\nu^T M_\nu \) commute: both are diagonalised by \( U_\nu \).
\( \rho(g_\nu) \) - known: \( U_\nu \) constrained or determined (up to Majorana phases).
$U_e$ and $U_\nu$ constrained or determined ($U_\nu$ up to Majorana phases):

$U_{\text{PMNS}} = U_e^\dagger U_\nu$ constrained or determined (up to the Majorana phases)

The constraints depend on: $G_f$, $\rho(g_f)$, $G_e$ and $G_\nu$.

$G_f = A_4$, $S_4$, $T'$, $A_5$.

$A_4$: 3 $Z_2$, 4 $Z_3$, 1 $Z_2 \times Z_2$ subgroups (total 8).

$T'$: similar to $A_4$.

$S_4$: 9 $Z_2$, 4 $Z_3$, 3 $Z_4$, 4 $Z_2 \times Z_2$ subgroups (total 20).

$A_5$: has 15 $Z_2$, 10 $Z_3$, 6 $Z_5$, 5 $Z_2 \times Z_2$ subgroups (36).
In models with $G_\nu = Z_2 \times Z_2$:

$U_\nu$ - determined up to re-phasing on the right and permutations of columns; the latter can be fixed within a specific model.

In models with $G_\nu = Z_2$:

$U_\nu$ - two free parameters, one angle and a phase, as long as the neutrino Majorana mass term does not have additional “accidental” symmetries, e.g., the $\mu - \tau$ symmetry; otherwise, determined up to re-phasing on the right and permutations of columns.
TBM form of $\tilde{U}_\nu$:

a) from $G_f = S_4$, $G_\nu = Z_2^S \times Z_2^U$ ($S, U$ generators of $S_4$ are unbroken).

b) from $G_f = A_4$, $G_\nu = Z_2^S$ ($S$ generator of $A_4$ is unbroken) + $\mu - \tau$ accidental symmetry.

c) from $G_f = T'$, $G_\nu = Z_2$ (+ $TST^2$ element of $T'$ - unbroken).

BM form of $\tilde{U}_\nu$:

from $G_f = S_4$, $G_\nu = Z_2 + \mu - \tau$ accidental symmetry.

In all these cases: $l_L(x)$, $\nu_{lL}(x)$, $l = e, \mu, \tau$ - triplets of $G_f$. 

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
Examples

TBM form of $\tilde{U}_\nu$:

$G_f = S_4$, $G_\nu = Z_2^S \times Z_2^U$ ($S, U$ generators of $S_4$ are unbroken).

$S_4$ generators $S, T, U$, presentation rules:

$S^2 = T^3 = (ST)^3 = U^2 = (TU)^2 = (SU)^2 = (STU)^4 = 1$

In the $3$ and $3'$ representations and convenient basis,

$S = \frac{1}{3} \begin{pmatrix} -1 & 2 & 2 \\ 2 & -1 & 2 \\ 2 & 2 & -1 \end{pmatrix},$ $T = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \omega^2 & 0 \\ 0 & 0 & \omega \end{pmatrix},$ $U = \mp \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix},$

where $\omega = e^{i \frac{2\pi}{3}}$.

Results for $U_{\text{PMNS}}$ are basis-independent.
Choose: \[ G_e = Z_3^T = \{1, T, T^2\}; \]

\[ \rho(g_e) \equiv T, \; T - \text{diagonal: } U_e = \text{diag}(1, 1, 1). \]

\[ G_\nu = Z_2^S \times Z_2^U, \; Z_2^U = \{1, U\}, \; Z_2^S = \{1, S\}; \]

\[ \rho(g_\nu) \equiv U, S: \; U, S \; \text{diagonalised by } U_\nu = V_{\text{TBM}}. \]

\[ U_{\text{PMNS}} = U_e^\dagger U_\nu = V_{\text{TBM}} \]

Problem: \[ \theta_{13} = 0 \ (\!) \]

Solution: \[ G_\nu = Z_2^S, \; Z_2^S = \{1, S\}; \; \rho(g_\nu) = S; \]

\[ V_{\text{TBM}}^\dagger S V_{\text{TBM}} = \text{diag}(-1, 1, -1). \]

Thus, \[ U_\nu = V_{\text{TBM}} U_{13}(\theta_{13}^\nu, \alpha) P(\xi_{21}, \xi_{31}), \]
$U_{13}(\theta_{13}^\nu, \alpha) = \begin{pmatrix} \cos \theta_{13}^\nu & 0 & \sin \theta_{13}^\nu e^{i\alpha} \\ 0 & 1 & 0 \\ -\sin \theta_{13}^\nu e^{-i\alpha} & 0 & \cos \theta_{13}^\nu \end{pmatrix}$. \\

**Predictions:** $\sin^2 \theta_{12} = 1/(3(1 - \sin^2 \theta_{13})) \approx 0.340$, $\cos \delta = \cos \delta(\theta_{13}, \theta_{23})$;

**Best fit values of $\sin^2 \theta_{13}$, $\sin^2 \theta_{23}$:**
$\cos \delta = 0.73 \ (\delta = \pm 43.3^\circ), \ \text{NO}$;
$\cos \delta = -0.86 \ (\delta = 180^\circ \pm 30.1^\circ), \ \text{IO}$.

**The predictions are testable experimentally:** will be tested at JUNO, T2K, NO$\nu$A, T2HK, DUNE experiments.
Generalised CP Invariance

\[ H^\nu_{\text{CP}} = \{ X_\nu \} \] \hspace{1em} \text{GCP unitary transformations}

\[ X_\nu \] \hspace{1em} \text{forming a (residual) CP symmetry of} \ M_\nu:\ \ X_\nu^T M_\nu X_\nu = M_\nu^*. \]

\text{Consistency condition between} \ G_\nu \ (\text{i.e.,} \ \rho(g_\nu)) \ \text{and} \ H^\nu_{\text{CP}} \ \text{has to be respected:}

\[ X_\nu \rho^*(g_\nu) X_\nu^{-1} = \rho(g'_\nu). \]

\[ g^{(l)}_\nu \] \hspace{1em} \text{an element of} \ G_\nu ;

\[ \rho \] \hspace{1em} \text{the unitary representation of} \ G_f \ \text{acting on} \ \nu_L(x) ;

\[ \rho(g^{(l)}_\nu) \] \hspace{1em} \text{action of} \ G_\nu \ \text{on} \ \nu_L(x), \ l = e, \mu, \tau .

\text{GCP invariance of} \ M_\nu \ \text{determines the Majorana phases in} \ U_{\text{PMNS}} .

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
None of the symmetries leading to $U_{TBM}$, $U_{BM}$ or other approximate forms of $U_{PMNS}$ can be exact.

Which is the correct approximate symmetry, i.e., approximate form of $U_{PMNS}$ (if any)?

In the cases of $U_\nu$ given by $U_{TBM}$, $U_{BM}$, etc. the requisite corrections of some of the mixing angles are small and can be considered as perturbations to the corresponding symmetry values.

Depending on the symmetry leading to $U_{TBM, BM}$, etc. and on the form of $U_{lep}$, one obtains different experimentally testable predictions for the sum of the neutrino masses, the neutrino mass spectrum, the nature (Dirac or Majorana) of $\nu_j$ and the CP violating phases in the neutrino mixing matrix. Future data will help us understand whether there is some new fundamental symmetry behind the observed patterns of neutrino mixing and $\Delta m^2_{ij}$.

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
Predictions and Correlations I

\[ U_\nu = U_{\text{TBM,BM,GRA,GRB,HG}} \bar{P}(\xi_1, \xi_2); \ \theta_{12}; \]

\[ U_\ell^\dagger = R_{12}(\theta_{12}^\ell) Q, \ Q = \text{diag}(e^{i\varphi}, 1, 1) \]
(\text{the “minimal” = simplest case (SU}(5) \times T', \ldots)\]

\[ U_\ell^\dagger = R_{12}(\theta_{12}^\ell) R_{23}(\theta_{23}^\ell) Q, \ Q = \text{diag}(1, e^{-i\psi}, e^{-i\omega}) \]
(\text{next-to-minimal case})

\[ \cos \delta = \cos \delta(\theta_{12}, \theta_{23}, \theta_{13}; \theta_{12}^\nu, \ldots), \]

\[ J_{CP} = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}, \delta) = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}; \theta_{12}^\nu, \ldots), \]

\[ \theta_{12}^\nu, \ldots - \text{known (fixed) parameters, depend on the underlying symmetry.} \]
For arbitrary fixed $\theta_{12}^{\nu}$ and any $\theta_{23}$ ("minimal" and "next-to-minimal" cases):

$$\cos \delta = \frac{\tan \theta_{23}}{\sin 2\theta_{12} \sin \theta_{13}} \left[ \cos 2\theta_{12}^{\nu} + (\sin^2 \theta_{12} - \cos^2 \theta_{12}^{\nu}) (1 - \cot^2 \theta_{23} \sin^2 \theta_{13}) \right].$$

This results is exact.

"Minimal" case: $\sin^2 \theta_{23} = \frac{1}{2} \frac{1-2 \sin^2 \theta_{13}}{1-\sin^2 \theta_{13}}.$
In all cases TBM, BM (LC), GRA, GRB, HG:

- New sum rules relating $\theta_{12}, \theta_{13}, \theta_{23}$ and $\delta$;
- $J_{CP} = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}, \delta) = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}; \theta_{12}^\nu)$.

\( J_{CP} = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}, \delta) = J_{CP}(\theta_{12}, \theta_{23}, \theta_{13}; \theta_{12}^\nu) \).

- TBM case: \( \delta \approx 3\pi/2 \) or \( \pi/2 \); b.f.v. of \( \theta_{ij} \):
  \( \delta \approx 263.5^\circ \) or \( 96.5^\circ \), \( \cos\delta = -0.114 \), \( J_{CP} \approx \mp 0.034 \).

- GRAM case, b.f.v. of \( \theta_{ij} \): \( \delta \approx 286.8^\circ \) or \( 73.2^\circ \);
  \( \cos\delta = 0.289 \), \( J_{CP} \approx \mp 0.0327 \).

- GRBM case, b.f.v. of \( \theta_{ij} \): \( \delta \approx 258.5^\circ \) or \( 101.5^\circ \);
  \( \cos\delta = -0.200 \), \( J_{CP} \mp 0.0333 \).

- HGM case, b.f.v. of \( \theta_{ij} \): \( \delta \approx 298.4^\circ \) or \( 61.6^\circ \);
  \( \cos\delta = 0.476 \), \( J_{CP} \approx \mp 0.0299 \).

- BM, LC cases: \( \delta \approx \pi \), \( \cos\delta \approx -0.978 \), \( J_{CP} \approx \mp 0.008 \)

The results shown - for NO neutrino mass spectrum; the results are practically the same for IO spectrum. (Best fit values of \( \theta_{ij} \): F. Capozzi et al., arXiv:1312.2878v1.)

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
By measuring $\cos \delta$ or $\delta$ and using high precision data on $\theta_{12}$, $\theta_{23}$ and $\theta_{13}$, one can distinguish between different symmetry forms of $\tilde{U}_\nu$!

Relatively high precision measurement of $\delta$ will be performed at the future planned neutrino oscillation experiments, (DUNE, T2HK) see, e.g., R. Acciarri et al. [DUNE Collab.], arXiv:1512.06148, 1601.05471 and 1601.02984; K. Abe et al. [T2HK Proto-Collab.], arXiv:1502.05199 (PTEP 2015 (2015) 053C02).
Statistical analysis, likelihood method; input “data”: $\sin^2 \theta_{13}$, $\sin^2 \theta_{12}$, $\sin^2 \theta_{12}$, $\delta$

$L(\cos \delta) \propto \exp \left( -\frac{\chi^2(\cos \delta)}{2} \right)$

$n \sigma$ confidence level interval of values of $\cos \delta$:

$L(\cos \delta) \geq L(\chi^2_{\text{min}}) \cdot L(\chi^2 = n^2)$

TBM, GRA, GRB, HG: $J_{\text{CP}} = 0$ excluded at 5σ, 4σ, 4σ, 3σ confidence level.

At 3σ: $0.020 \leq |J_{\text{CP}}| \leq 0.039$.

BM (LC), b.f.v.: $J_{\text{CP}} = 0$;
at 3σ: $-0.026 (-0.025) \leq J_{\text{CP}} \leq 0.021 (0.023)$ for NO (IO) neutrino mass spectrum.
Prospective precision:

\[ \delta(\sin^2 \theta_{12}) = 0.7\% \text{ (JUNO)}, \]
\[ \delta(\sin^2 \theta_{13}) = 3\% \text{ (Daya Bay)}, \]
\[ \delta(\sin^2 \theta_{23}) = 5\% \text{ (T2K, NO\(\nu\)A combined)}. \]
b.f.v. of $\sin^2 \theta_{12,23}$ (Capozzi et al., 2014), $\sin^2 \theta_{12} = 0.33$, + the prospective precision used.
b.f.v. of $\sin^2 \theta_{ij}$ (Esteban et al., Jan., 2018) + the prospective precision used.

$$\cos \delta = \frac{\tan \theta_{23}}{\sin 2 \theta_{12} \sin \theta_{13}} \left[ \cos 2 \theta_{12} \nu + (\sin^2 \theta_{12} - \cos^2 \theta_{12} \nu) (1 - \cot^2 \theta_{23} \sin^2 \theta_{13}) \right].$$

$\delta(\sin^2 \theta_{23}) = 3\%$ (T2HK, DUNE).
GRB - HG $> 3\sigma$; GRA - GRB $\geq 2\sigma$; TMB - HG $\cong 3\sigma$; TMB - GRA $\cong 2\sigma$.

Agarwalla, Chatterjee, STP, Titov, arXiv:1711.02107

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
In I. Girardi *et al.*., arXiv:1509.02502, all symmetry breaking patterns, i.e., all possible combinations of residual symmetries $G_e$ and $G_\nu$ of the lepton flavour symmetry groups $G_f = S_4$, $A_4$, $T'$ and $A_5$, which could lead to correlations between some of the three neutrino mixing angles and/or between the neutrino mixing angles and the Dirac CPV phase $\delta$, were considered.

**A** $G_e = Z_2$ and $G_\nu = Z_k$, $k > 2$ or $Z_m \times Z_n$, $m, n \geq 2$;  
**B** $G_e = Z_k$, $k > 2$ or $Z_m \times Z_n$, $m, n \geq 2$ and $G_\nu = Z_2$;  
**C** $G_e = Z_2$ and $G_\nu = Z_2$.

In these cases $U_e^\dagger$ and/or $U_\nu$ of $U = U_e^\dagger U_\nu = (\tilde{U}_e)^\dagger \psi \tilde{U}_\nu Q_0$, are partially (or fully) determined by residual discrete symmetries of $G_f = S_4$, $A_4$, $T'$ and $A_5$. 

---

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
More specifically:

**A.** $G_e = Z_2$, $G_\nu = Z_n$, $n > 2$ or $Z_n \times Z_m$, $n, m \geq 2$; $U_\nu$ fixed; $U_e = U_{ij}(\theta_{ij}^e, \delta_{ij})$, $ij = 12(A1); 13(A2), 23(A3)$;

A1, A2 (A3): $\sin^2 \theta_{23}$, $\cos \delta (\theta_{12}, \theta_{13})$ predicted.

**B.** $G_e = Z_n$, $n > 2$ or $G_e = Z_n \times Z_m$, $n, m \geq 2$, $G_\nu = Z_2$; $U_\nu = U_{\text{sym}} U_{ij}(\theta_{ij}^\nu, \delta_{ij}) Q_0$, $ij = 13, 12, 23$ (B1, B2, B3); $U_e$ fixed; B1, B2 (B3): $\theta_{12}$, $\cos \delta (\theta_{23}, \theta_{13})$ predicted.

**C.** $G_e = Z_2$ and $G_\nu = Z_2$: $U_e$ - up to $U_{ij}(\theta_{ij}^e, \delta_{ij})$, $U_\nu$ - up to $U_{ij}(\theta_{ij}^\nu, \delta_{ij})$, $ij = 12; 13, 23$ (C1 - C9); $\sin^2 \theta_{12}$ or $\sin^2 \theta_{23}$ or $\cos \delta$ predicted.
In the case of $G_e = Z_2$ ($G_\nu = Z_2$), $U_e$ ($U_\nu$) is determined up to a $U(2)$ transformation in the degenerate subspace. When the residual symmetry is large enough, namely, $G_e = Z_n$, $n > 2$ or $G_e = Z_n \times Z_m$, $n, m \geq 2$ and/or $G_\nu = Z_2 \times Z_2$ ($G_\nu = Z_n$, $n > 2$ or $Z_n \times Z_m$, $n, m \geq 2$) for Majorana (Dirac) neutrinos, $U_e$ and/or $U_\nu$ are/is fixed (up to diagonal phase matrices on the right, which are either unphysical for Dirac neutrinos, or contribute to the Majorana phases otherwise, and permutations of columns) by the residual symmetries of the charged lepton and neutrino mass matrices.

In the case when the discrete symmetry $G_f$ is fully broken in one of the two sectors, the corresponding mixing matrix $U_e$ or $U_\nu$ is unconstrained and contains in general three angles and six phases.
\( G_f = A_4, \ S_4, \ T', \ A_5. \)

\( A_4: \) 3 \( Z_2 \), 4 \( Z_3 \), 1 \( Z_2 \times Z_2 \) subgroups (total 8).

\( T': \) similar to \( A_4. \)

\( S_4: \) 9 \( Z_2 \), 4 \( Z_3 \), 3 \( Z_4 \), 4 \( Z_2 \times Z_2 \) subgroups (total 20).

\( A_5: \) has 15 \( Z_2 \), 10 \( Z_3 \), 6 \( Z_5 \), 5 \( Z_2 \times Z_2 \) subgroups (36).
In the case of $A_4$ ($T'$) symmetry only there are 64 models (up to permutation of rows and columns).

$A_4$:

$(G_e, G_\nu) = (Z_2, Z_3)$, $A1 - A3$;
$(G_e, G_\nu) = (Z_2, Z_2)$, $A1 - A3$;
$(G_e, G_\nu) = (Z_3, Z_2)$, $B1 - B3$;
$(G_e, G_\nu) = (Z_2 \times Z_2, Z_2)$, $B1 - B3$;
$(G_e, G_\nu) = (Z_2, Z_2)$, $C1 - C9$.

For $A_4$, $S_4$ and $A_5$ the total number of models to be analysed is extremely large. However, a total of only 14 models survive the 3\(\sigma\) constraints on $\sin^2 \theta_{ij}$ from the current data and the requirement $|\cos \delta| \leq 1$. 

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
Phenomenologically Viable Predictions

**A1 (A2), A<sub>5</sub> (G<sub>e</sub> = Z<sub>2</sub>, G<sub>ν</sub> = Z<sub>3</sub> (Dirac ν<sub>j</sub>))**:  
\[
\sin^2 \theta_{23} \cong 0.553 (0.447); \cos \delta \cong 0.716 (-0.716).
\]

**A1, S<sub>4</sub>:**  
\[
\sin^2 \theta_{23} \cong 0.5(1 - \sin^2 \theta_{13}) \cong 0.489; \quad \cos \delta \cong -1 \text{ requires } \sin^2 \theta_{12} \cong 0.348 (!)
\]

**B1, A<sub>4</sub> (T', S<sub>4</sub>, A<sub>5</sub>) (G<sub>e</sub> = Z<sub>3</sub><sup>T</sup>, G<sub>ν</sub> = Z<sub>2</sub><sup>S</sup>):**  
\[
U_{PMNS} = U_{TBM} U_{13}(\theta^\nu_{13}, \delta_{13}) Q^0; \quad \sin^2 \theta_{12} = 1/(3 \cos^2 \theta_{13}) \cong 0.340; \quad \cos \delta \cong 0.570.
\]

**B2, S<sub>4</sub> (G<sub>e</sub> = Z<sub>3</sub><sup>T</sup>, G<sub>ν</sub> = Z<sub>2</sub><sup>SU</sup>):**  
\[
\sin^2 \theta_{12} \cong (1 - 2 \sin^2 \theta_{13})/3 \cong 0.319; \cos \delta \cong -0.269.
\]
Future: $\delta(\sin^2 \theta_{23}) = 3\%$ (T2HK, DUNE).
Future: $\delta(\delta) = 10^\circ$. 
Future: $\delta(\sin^2 \theta_{12}) = 0.7\%$ (JUNO).

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
A total of 6 models would survive out of the currently viable 14 (of the extremely large number) considered if $\delta(\sin^2 \theta_{23}) = 3\%$, $\delta(\sin^2 \theta_{12}) = 0.7\%$ and the current b.f.v. would not change:

A1A5, C2S4, C3, C3A5, C4A5, C8.

Will be constrained further by the data on $\delta$. 
$\delta(\sin^2 \theta_{23}) = 3\% \ (T2HK, \ DUNE); \ current \ b.f.v.$
\[ \delta(\sin^2 \theta_{23}) = 3\% \text{ (T2HK, DUNE);} \]
\[ \delta(\sin^2 \theta_{12}) = 0.7\% \text{ (JUNO);} \]
**current b.f.v. used.**

S.T. Petcov, SSP 2018, Aachen, 11/06/2018

S.T. Petcov, SSP 2018, Aachen, 11/06/2018
The predictions obtained for $\cos \delta$ are valid in a large class of theoretical models of (lepton) flavour based on discrete symmetries.

$T'$ model of lepton flavour: $U_{\text{TBM}}$, $\delta \approx 3\pi/2$ or $\pi/2$.

- Light neutrino masses: type I seesaw mechanism.
- $\nu_j$ - Majorana particles.
- Diagonalisation of $M_\nu$: $U_{\text{TBM}} \Phi$, $\Phi = \text{diag}(1, 1, 1(i))$
- $U_{\text{TBM}}$ “corrected” by $U^\dagger_\text{lep} Q = R_{12}(\theta_{12}^\ell) R_{23}(\theta_{23}^\ell) Q$, $Q = \text{diag}(1, e^{i\phi}, 1)$
$T'$ model of lepton flavour: $U_{\text{TBM}}, \delta \approx 3\pi/2$ or $\pi/2$.

- $T'$: double covering of $A_4$ (tetrahedral symmetry group).

- $T'$: 1, 1', 1''; 2, 2', 2''; 3.

- $T'$ model: $\psi_{eL}(x), \psi_{\mu L}(x), \psi_{\tau L}(x)$ - triplet of $T'$; $e_R(x), \mu_R(x)$ - a doublet, $\tau_R(x)$ - a singlet, of $T'$; $\nu_{eR}(x), \nu_{\mu R}(x), \nu_{\tau R}(x)$ - a triplet of $T'$; the Higgs doublets $H_u(x), H_d(x)$ - singlets of $T'$.

- The discrete symmetries of the model are $T' \times H_{\text{CP}} \times Z_8 \times Z_4^2 \times Z_3^2 \times Z_2$, the $Z_n$ factors being the shaping symmetries of the superpotential required to forbid unwanted operators.
Predictions of the $T'$ Model

- $m_{1,2,3}$ determined by 2 real parameters + $\Phi^2$:
  \[
  \frac{1}{m_1} - \frac{2}{m_2} = \frac{1}{m_3}, \quad \text{NO}
  \]

  NO, A : \((m_1, m_2, m_3) = (4.43, 9.75, 48.73) \cdot 10^{-3} \text{ eV} ,

  NO, B : \((m_1, m_2, m_3) = (5.87, 10.48, 48.88) \cdot 10^{-3} \text{ eV} ,

  IO : \((m_1, m_2, m_3) = (51.53, 52.26, 17.34) \cdot 10^{-3} \text{ eV} ,

  NO A : \sum_{j=1}^{3} m_j = 6.29 \times 10^{-2} \text{ eV} ,

  NO B : \sum_{j=1}^{3} m_j = 6.52 \times 10^{-2} \text{ eV} ,

  IO : \sum_{j=1}^{3} m_j = 12.11 \times 10^{-2} \text{ eV} ,
• $\theta_{12}, \theta_{23}, \theta_{13}, \delta, \alpha_{21}, \alpha_{31}$ determined by 3 real parameters.

Given the values of $\theta_{12}, \theta_{23}, \theta_{13}, \delta, \alpha_{21}, \alpha_{31}$ are predicted:

$$\delta \cong 3\pi/2 \ (266^\circ) \ (\text{or} \ \pi/2 \ (94^\circ));$$

NO A: $\alpha_{21} \cong +47.0^\circ \ (\text{or} \ -47.0^\circ) \ (+2\pi),$

$$\alpha_{31} \cong -23.8^\circ \ (\text{or} \ +23.8^\circ) \ (+2\pi).$$

The model is falsifiable.
Conclusions.

- The observed pattern of neutrino mixing can be due to a new fundamental (approximate) symmetry of particle interactions leading to an approximate symmetry form of the PMNS matrix. We have considered the following symmetry forms: TBM, BM (LC), GRA, GRB and HG. Each of these forms can be obtained from a specific discrete flavour symmetry.

- For all the forms considered $\theta_{13}^{\nu} = 0$ and $\theta_{23}^{\nu} = -\pi/4$. The forms differ by the value of $\theta_{12}^{\nu}$. Values of the neutrino mixing angles $\theta_{ij}$ compatible with the observations are obtained with the help of subleading (perturbative) corrections generated by $U_{\text{lep}}$ coming from the diagonalisation of the charged lepton mass matrix.

- The most important testable consequence of this approach to understanding the pattern of neutrino mixing is the correlation between the value of $\cos \delta$ and the values of the neutrino mixing angles: $\delta = \delta(\theta_{12}, \theta_{13}, \theta_{23}; \theta_{12}^{\nu})$. The correlation depends on the underlying approximate symmetry form of the $U_{\text{PMNS}}$.

- The precise knowledge of the value of $\sin^2 \theta_{23}$, in particular, is crucial for testing the predictions obtained following the approach discussed by us and for discriminating between various cases possible within this approach.
The measurement of the Dirac phase in the PMNS mixing matrix, together with an improvement of the precision on the mixing angles $\theta_{12}$, $\theta_{13}$ and $\theta_{23}$, can provide unique information about the possible existence of new fundamental symmetry in the lepton sector.
