

# Data management

## Long term planning

---

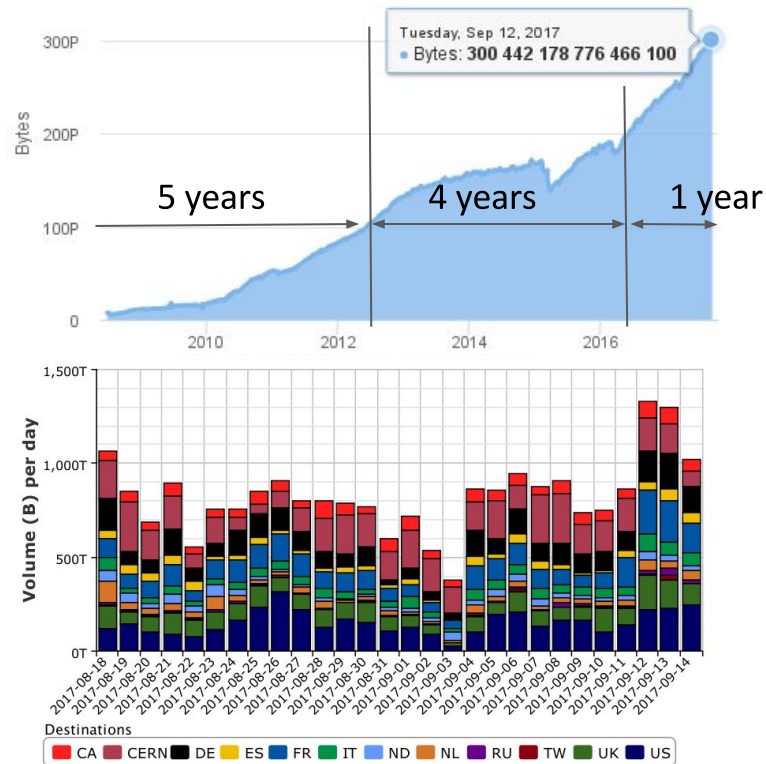

[Mario.Lassnig@cern.ch](mailto:Mario.Lassnig@cern.ch)

[Cedric.Serfon@cern.ch](mailto:Cedric.Serfon@cern.ch)

and the data management crew

# Current situation

- ↪ We recently breached 300 Petabytes!
  - ↪ 850M files, 200M containers, 130M datasets
- ↪ Many Rucio developments
  - ↪ Release 1.13.0 ("Donkerine") is out
  - ↪ 2 epics, 19 improvements, 27 features, 23 bug fixes
- ↪ Smooth operations
  - ↪ Consolidation of resources / getting rid of small RSEs
  - ↪ Validation of new monitoring
- ↪ Many new projects, some already in production
  - ↪ XCache
  - ↪ ECHO
  - ↪ Cloud storage federations
  - ↪ Network tuning and alarming

# Run-3 readiness and scalability 1/3

- ↪ Clean codebase (155'399 LOC)
  - ↪ Patches/Features are tracked via JIRA & git
  - ↪ PEP8 style-guide conformant, Flake code checker rates the code at ~8.0/10
  - ↪ Thoroughly tested (>400 unit tests)
- ↪ Rucio is designed to be horizontally scalable
  - ↪ Stateless and streaming requests handlers
  - ↪ Elastic work sharding (can dynamically add/remove nodes or service instances)
- ↪ Frontend
  - ↪ CPU utilisation ~5%
  - ↪ Average network rate 2MB/sec
  - ↪ Peaks to 25 MB/sec
  - ↪ Stable memory behaviour (6GB/node, out of which 2-4GB are buffers)

# Run-3 readiness and scalability 2/3

- ↪ Clean codebase (155'399 LOC)
  - ↪ Patches/Features are tracked via JIRA & git
  - ↪ PEP8 style-guide conformant, Flake code checker rates the code at ~8.0/10
  - ↪ Thoroughly tested (>400 unit tests)
- ↪ Rucio is designed to be horizontally scalable
  - ↪ Stateless and streaming requests handlers
  - ↪ Elastic work sharding (can dynamically add/remove nodes or service instances)
- ↪ Services/Daemons
  - ↪ CPU utilisation ~20%
  - ↪ Average network rate 11MB/sec
  - ↪ Peaks to 120 MB/sec
  - ↪ Zigzag memory behaviour (6GB/node, out of which 3GB are buffers)

# Run-3 readiness and scalability 3/3

## ↳ Database

- ↳ Very low utilisation (compared to Oracle capabilities!), but very high usage
- ↳ Extremely optimised, in constant talks with DBAs
- ↳ No major problems for a very long time
- ↳ cf. [Database Ops Slides](#)

## ↳ However, lately we ran into some session problems (nr. of sessions exceeded)

- ↳ We artificially limit to 1000 reader and 1000 writer sessions to save Oracle resources
- ↳ Apache process handling seems to not terminate database sessions, even though process is gone
- ↳ Oracle-side process killer of sessions which are longer than Apache timeouts

# Of course, there are exceptions

---

- ↪ Rule evaluation service (a.k.a. judge) is limited by single node memory
  - ↪ Rule evaluations are done atomically, thus one evaluation happens within one database transaction
  - ↪ Daemon needs to load all files, replicas, etc. into memory
  - ↪ **Largest single successful evaluation yet on 8GB node: 500'000 files**
  - ↪ Instantaneous solution: high-memory nodes (but there are limits in what we can get)
  - ↪ Long-term solution for infinite size: Partition the evaluation across multiple transactions
  
- ↪ Rucio is currently "manually" elastic
  - ↪ Operations has to decide when to add new nodes or service instances
  - ↪ Fully automate this process based on node health and service metrics

# Major developments in the next months

---

## ↪ Rucio development

- ↪ Transparent archive/ZIP support
- ↪ Conveyor scheme/protocol improvements — protocols, clouds, and opportunistic resources
- ~~↪ GlobusOnline transfertool — required for managed transfers to/from HPCs~~

## ↪ Data management operations

- ↪ Enable even more sites to use rucio-mover and different upload/download protocols
- ↪ Evaluate ROOT and WebDAV als third-party copy protocols
- ↪ Ongoing monitoring validation
- ↪ Small sites decommissioning / consolidation
- ↪ New deployment model based on containers/dockers under evaluation

## ↪ Storage & network technologies

- ↪ Deployment of XrootD 4.7 — most importantly VOMS authz and client-side caching
- ↪ Xcache phase-1 deployment — SLAC, MWT2
- ↪ Network alarming & alerting — low throughput, high packet loss, ...

# What about long term? Our internal document

---

- ↪ Trace & document the progress of the different data management projects
- ↪ Long term planning tool (current milestones: end of Run-2, end of LS-2)
  
- ↪ 3 work packages (matching with ATLAS OTP)
  - ↪ Rucio development
  - ↪ Data management operations
  - ↪ Network & storage technologies
  
- ↪ Follows the discussions, workshops, documents from relevant coordinators
  - ↪ ATLAS Software & Computing Management
  - ↪ HEP Software Foundation
  - ↪ WLCG Data Steering Group
  - ↪ Non-ATLAS experiment feedback

# Collected recommendations

---

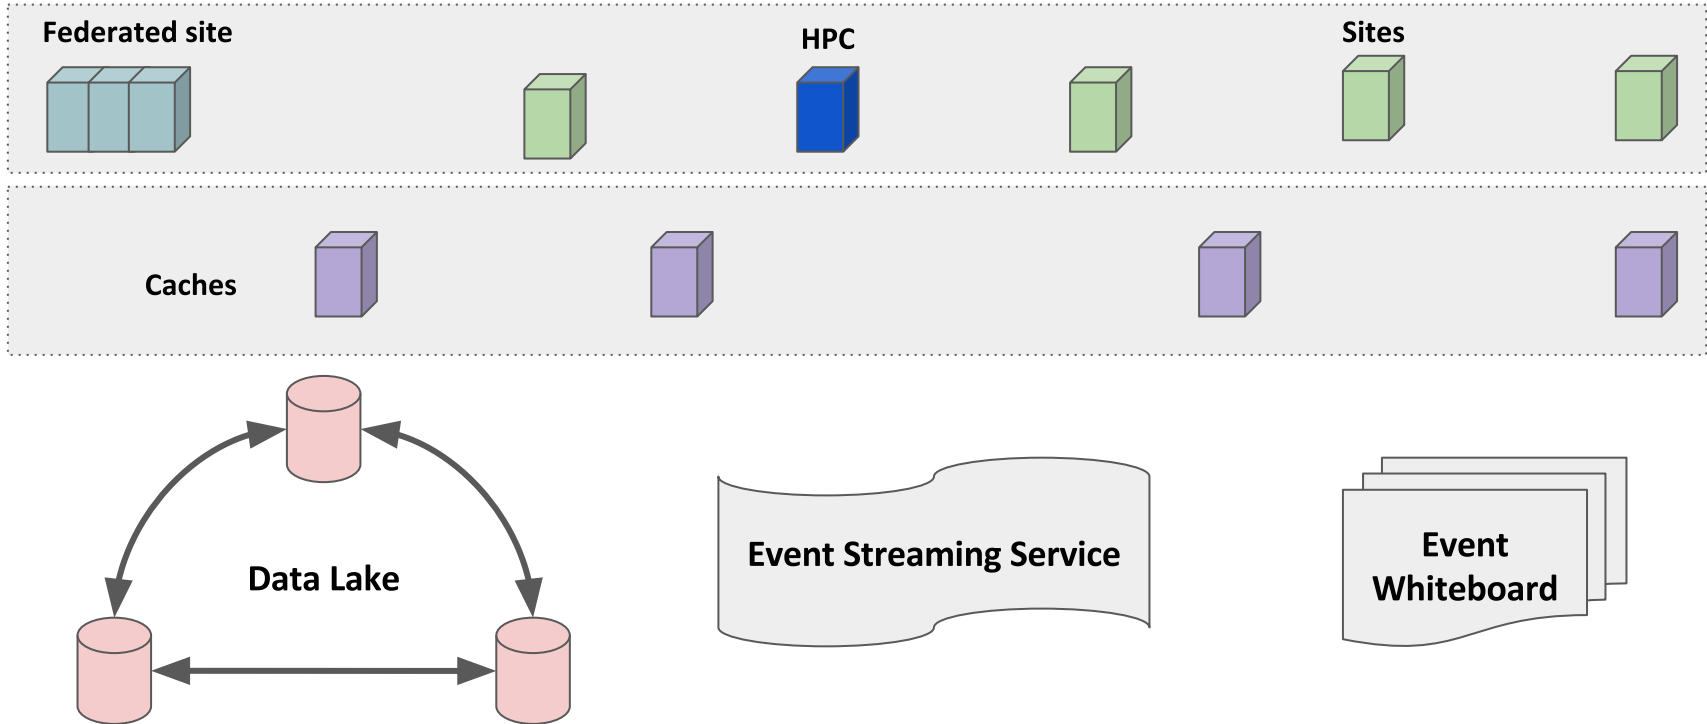

- ↪ WLCG Data Steering
  - ↪ Working on straw-man proposals, nothing concrete yet
  - ↪ Hot topics: authz without x509, increasing usage of TAPE, regional federations/caches
- ↪ SW&C Management
  - ↪ [Monday plenary](#)
  - ↪ ESS (event level processing), CDN (efficient caching and placement), DKB/Whiteboard (metadata)
  - ↪ Storage Performance Improvement Team (SPIT?) — also build on existing work of our CompSci PhDs
  - ↪ Reassess the use of object stores — more closely involve objectstore experts
- ↪ HSF CWPs which touched data management
  - ↪ [Computing Models](#) — equivalent to SW&C stance
  - ↪ [Data Access](#) — slightly more detailed on cataloguing, CDNs, caching, and IO patterns
  - ↪ [Machine Learning](#) — concerned about I/O throughput, file-types (serial/random IO), filesystems

# Some projects under discussion

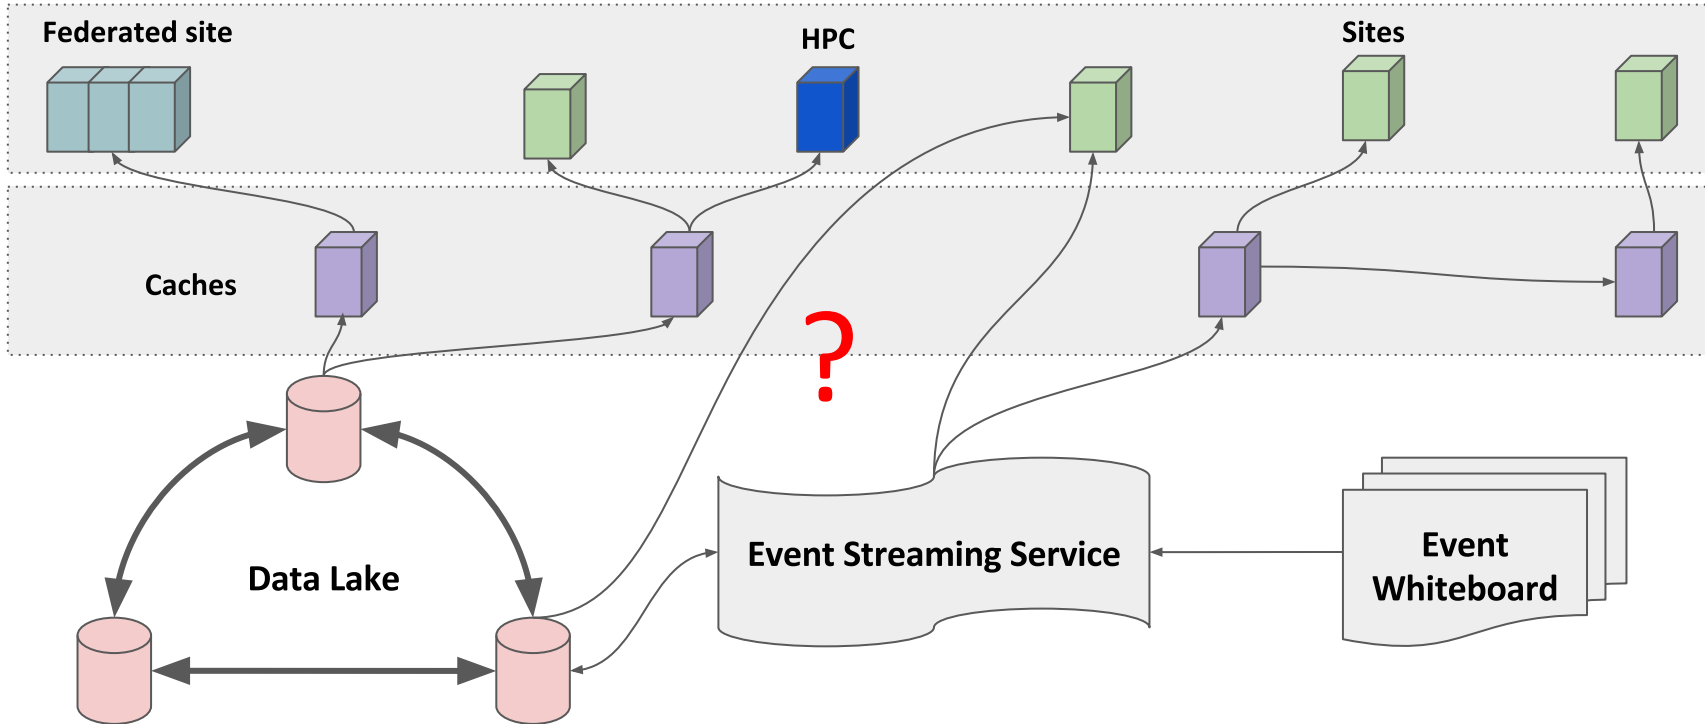

---

- ↪ Grab bag of ideas to automate our data management
- ↪ Service to automate archiving of small files to TAPE
- ↪ Self-healing rules / automatic handling of suspicious files
- ↪ Xcache Phase-2: Add more sites and test client-level caching
- ↪ Smarter lifetime model with finer granularity
- ↪ Testing of SDNs with network function virtualisation
  - ↪ The R&E networks will become heavily shared once more WLCG-scale experiments come online
  - ↪ Ensure that we have proper network shaping and control in place
- ↪ Usage of TAPE without SRM
- ↪ Downloads via Rucio WebUI
- ↪ ... and many more

# Streaming Content Delivery? Is it the new model?

# Streaming Content Delivery? Is it the new model?

# Streaming Content Delivery? Is it the new model?

- ↪ At first glance it looks like the tiered MONARC model all over again. What are the practical implications?
- ↪ Objective seems to be to trade CPU for storage
  - ↪ Secondaryise data on all sites for quick eviction, keep primaries only on data-lake
  - ↪ Recreate data products at fine granularity when necessary
  - ↪ Exploit small but fast caches everywhere for these fine granularity data products
- ↪ For many features mentioned in the CWP we have solutions either already in place or in some stage of development
  - ↪ e.g., rule-based data distribution, Xcache, network monitoring, asynchronous prefetch, ...
- ↪ Will have to come up with a very detailed plan for each step
  - ↪ We risk low utilisation/throughput at the beginning, is it acceptable?

# Data management beyond ATLAS

---

- ↪ AMS and Xenon1t are using Rucio in production
- ↪ COMPASS and LSST are evaluating it
- ↪ More experiments expressed interest, also from non-HEP domains
  
- ↪ Engage interested experiments —> **Rucio Community Workshop** early 2018!
- ↪ Ensure community-friendly Rucio development and deployment
  - ↪ move to Github, out-of-the-box deployment, out-of-the-box development, revise documentation
- ↪ Establish Rucio as complete, though modular, data management solution
  - ↪ e.g., experiments who would like to use Xcache, Object Stores, Event Streaming Service, ~~Globus~~Online
  - ↪ and ensure smooth cooperation with our WMFS system PanDA

# Licence and copyright

---

- ↪ Rucio redistribution licence is Apache Licence 2.0
  - ↪ Open source and free software (OSI approved)
  - ↪ Compatible with GNU General Public Licence 3.0 (but neither 1.0 nor 2.0)
- ↪ CERN holds Rucio copyright 'for the benefit' of ATLAS to permit the widest possible adoption and reuse (<http://legal.web.cern.ch/licensing/software>)
- ↪ Will seek licence clarification where we know/assume tight cooperation to ensure smooth further development and deployment
  - ↪ E.g., with external/non-CERN/non-ATLAS institutes
  - ↪ HSF Note: <http://hepsoftwarefoundation.org/notes/HSF-TN-2016-01.pdf>
  - ↪ We do not want to end up in a situation where a critical piece of software is in one way or the other licence-incompatible for a complete data management system
    - E.g., FTS, DynaFed, GFAL, XrootD/Xcache, GlobusOnline, ...

# Current effort allocation

---

## ↪ Rucio development

- ↪ 3.2 FTE across 6 persons
- ↪ Only 3 full-time (>66% time) developers though, reduction by 1 FTE in 2018 foreseen
- ↪ Partial help ( $\leq 20\%$  time) currently zero-sum due to overhead for existing developers
  - But very useful to attract new people who then want to stay for longer!
- ↪ No outside-ATLAS Rucio contributions yet, but actively pursuing

## ↪ Data management operations

- ↪ 1.8 FTE across 2 persons
- ↪ DDM/WFMS review recommended at least 2 FTE, actively trying to involve new people

## ↪ Storage & network technologies

- ↪ 2.2 FTE across 7 persons
- ↪ + unaccounted behind-the-scenes efforts from non-ATLAS persons

# Summary

---

- ↪ Data management is in a very good shape
  - ↪ For now, no major redesigns or rewrites required for Run-3
  - ↪ Lots of ideas and potential improvements to make our lives easier
- ↪ Recommendations from WLCG, SW&C, HSF CWP are the foundation for long-term
  - ↪ Event-level processing
  - ↪ Distributed caching
  - ↪ Metadata
- ↪ Paving the way for non-ATLAS deployments and contributions
- ↪ Effort allocation needs to be improved & dedicate larger fractions of time
  
- ↪ (and of course finish writing that journal article)
