

# Fragmentation Functions

## measurements at Belle

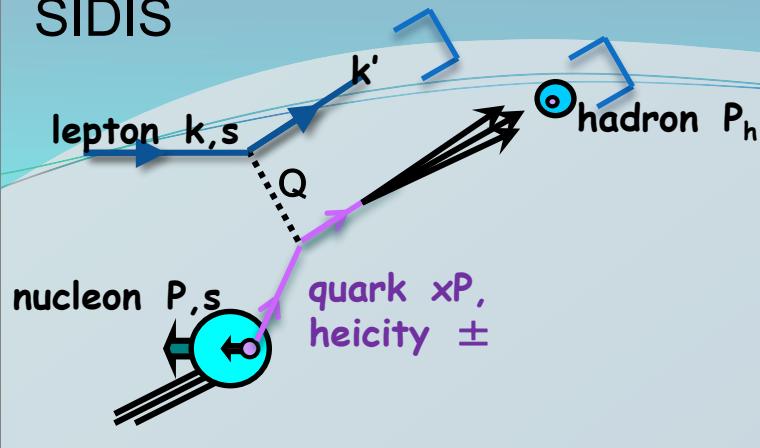

**DIS 2018, Kobe,  
April 15-20, 2018**

**Ralf Seidl (RIKEN)**

# Outline

- Single hadron fragmentation
  - Hyperon and charmed Baryon fragmentation
  - $\Lambda$  polarizing fragmentation
- Di-hadron fragmentation
  - Unpolarized mass, z dependence
- Other ongoing measurements (kt dependence)

# SIDIS

# Access to FFs

- SIDIS:  $\sigma^h(x, z, Q^2, P_{h\perp}) \propto \sum_q e_q^2 q(x, p_t, Q^2) D_{1,q}^h(z, k_t, Q^2)$

- Relies on unpol PDFs
- Parton momentum known at LO
- Flavor structure directly accessible
- Transverse momenta convoluted between FF and PDF

- pp:

$$\sigma^h(P_T) \propto \int_{x_1, x_2, z} \sum_{a, a' \in q, g} f_a(x_1) \otimes f_{a'}(x_2) \otimes \sigma_{aa'} \otimes D_{1,q}^h(z)$$

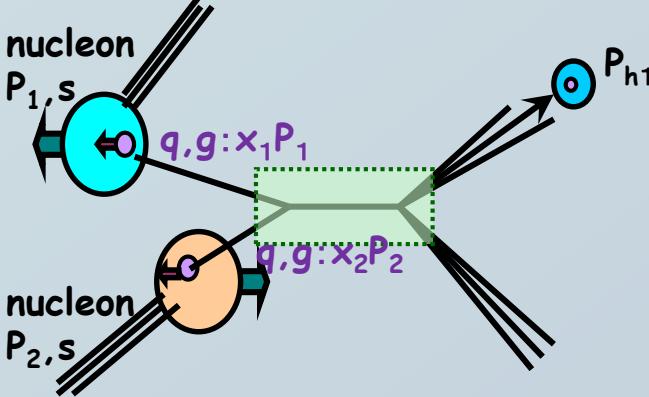

- Relies on unpol PDFs
- leading access to gluon FF
- Parton momenta not directly known

- e+e-:

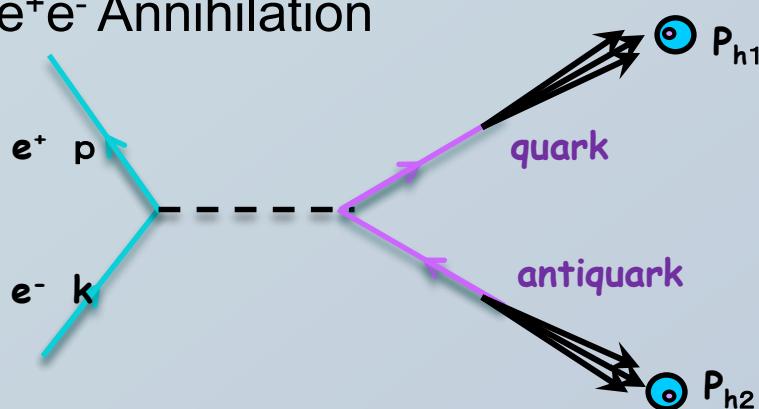

$$\sigma^h(z, Q^2, k_t) \propto \sum_q e_q^2 (D_{1,q}^h(z, k_t, Q^2) + D_{1,\bar{q}}^h(z, k_t, Q^2))$$

- No PDFs necessary
- Clean initial state, parton momentum known at LO
- Flavor structure not directly accessible

# pp collisions

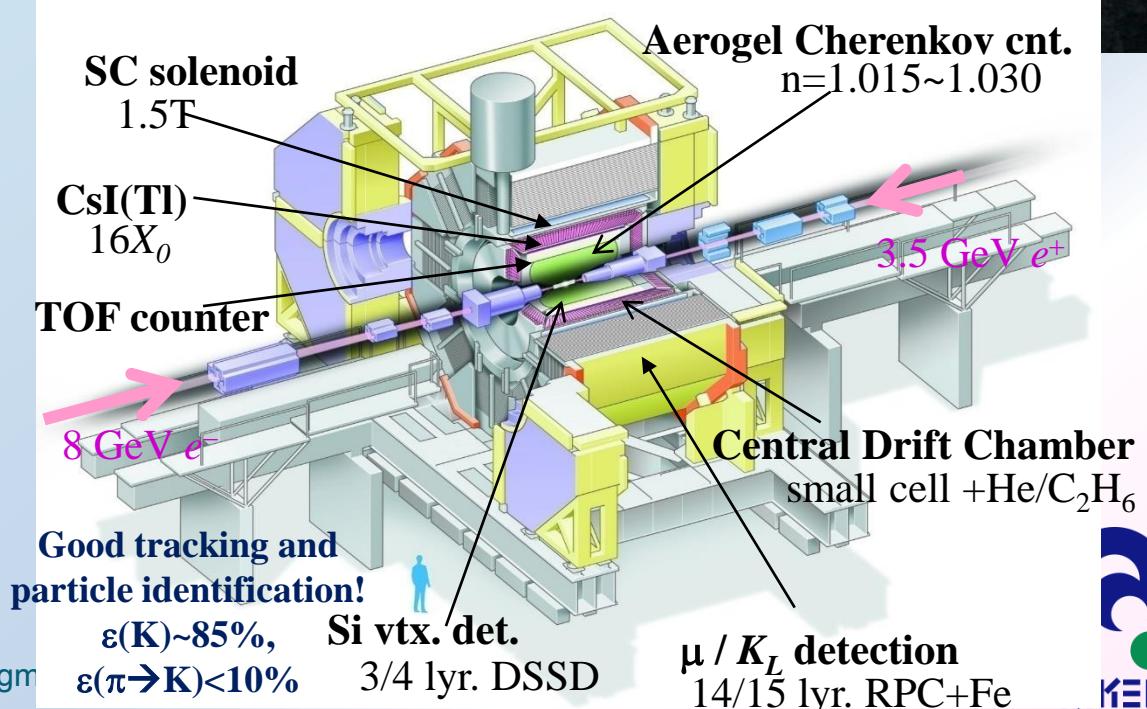

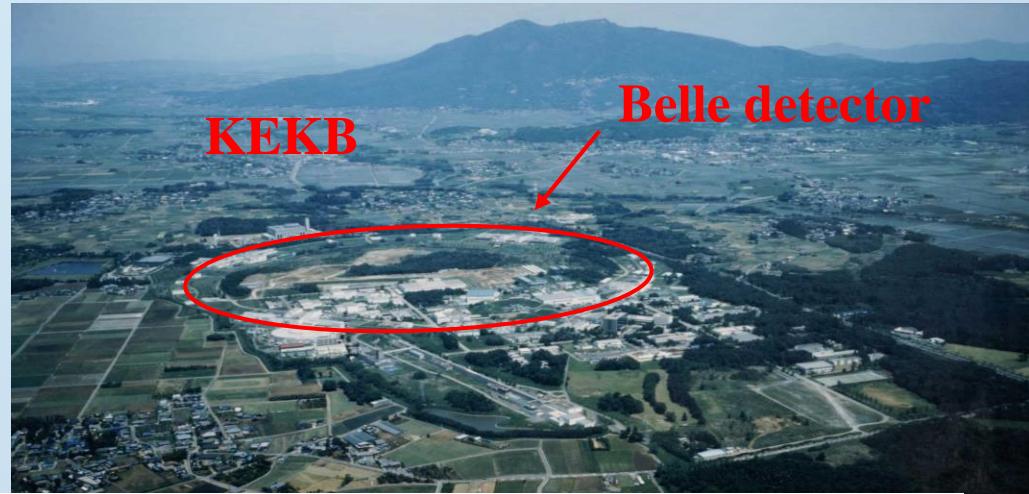

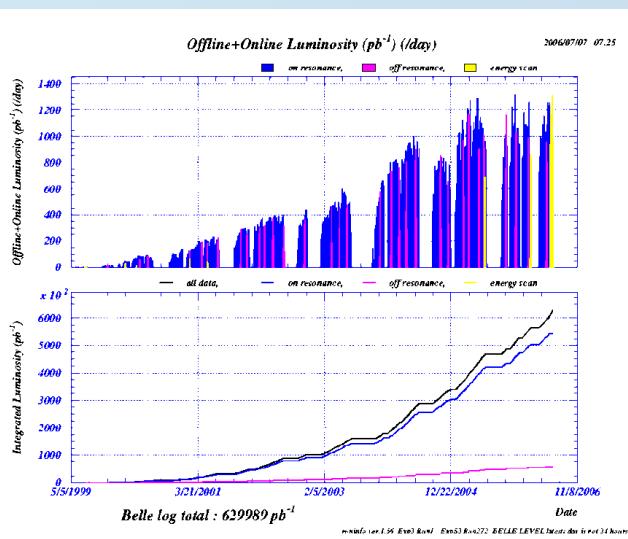

# e+e- Annihilation

# Belle Detector and KEKB

- Asymmetric collider
- 8GeV  $e^-$  + 3.5GeV  $e^+$
- $\sqrt{s} = 10.58\text{ GeV}$  ( $Y(4S)$ )
- $e^+e^- \rightarrow Y(4S) \rightarrow B\bar{B}$
- Continuum production:  
10.52 GeV
- $e^+e^- \rightarrow q\bar{q}$  (u,d,s,c)
- Integrated Luminosity:  $>1000\text{ fb}^{-1}$
- $>70\text{ fb}^{-1} \Rightarrow$  continuum

# Single hadron fragmentation

$$D_{1,\mathbf{q}}^h(z, Q^2)$$

$$D_{1,\mathbf{q}}^h(z, \mathbf{k}_T, Q^2)$$

$$H_{1,\mathbf{q}}^{\perp h}(z, \mathbf{k}_T, Q^2)$$

$$D_{1,\mathbf{q}}^{\perp h}(z, \mathbf{k}_T, Q^2)$$

$$H_{1,\mathbf{q}}^h(z, Q^2)$$

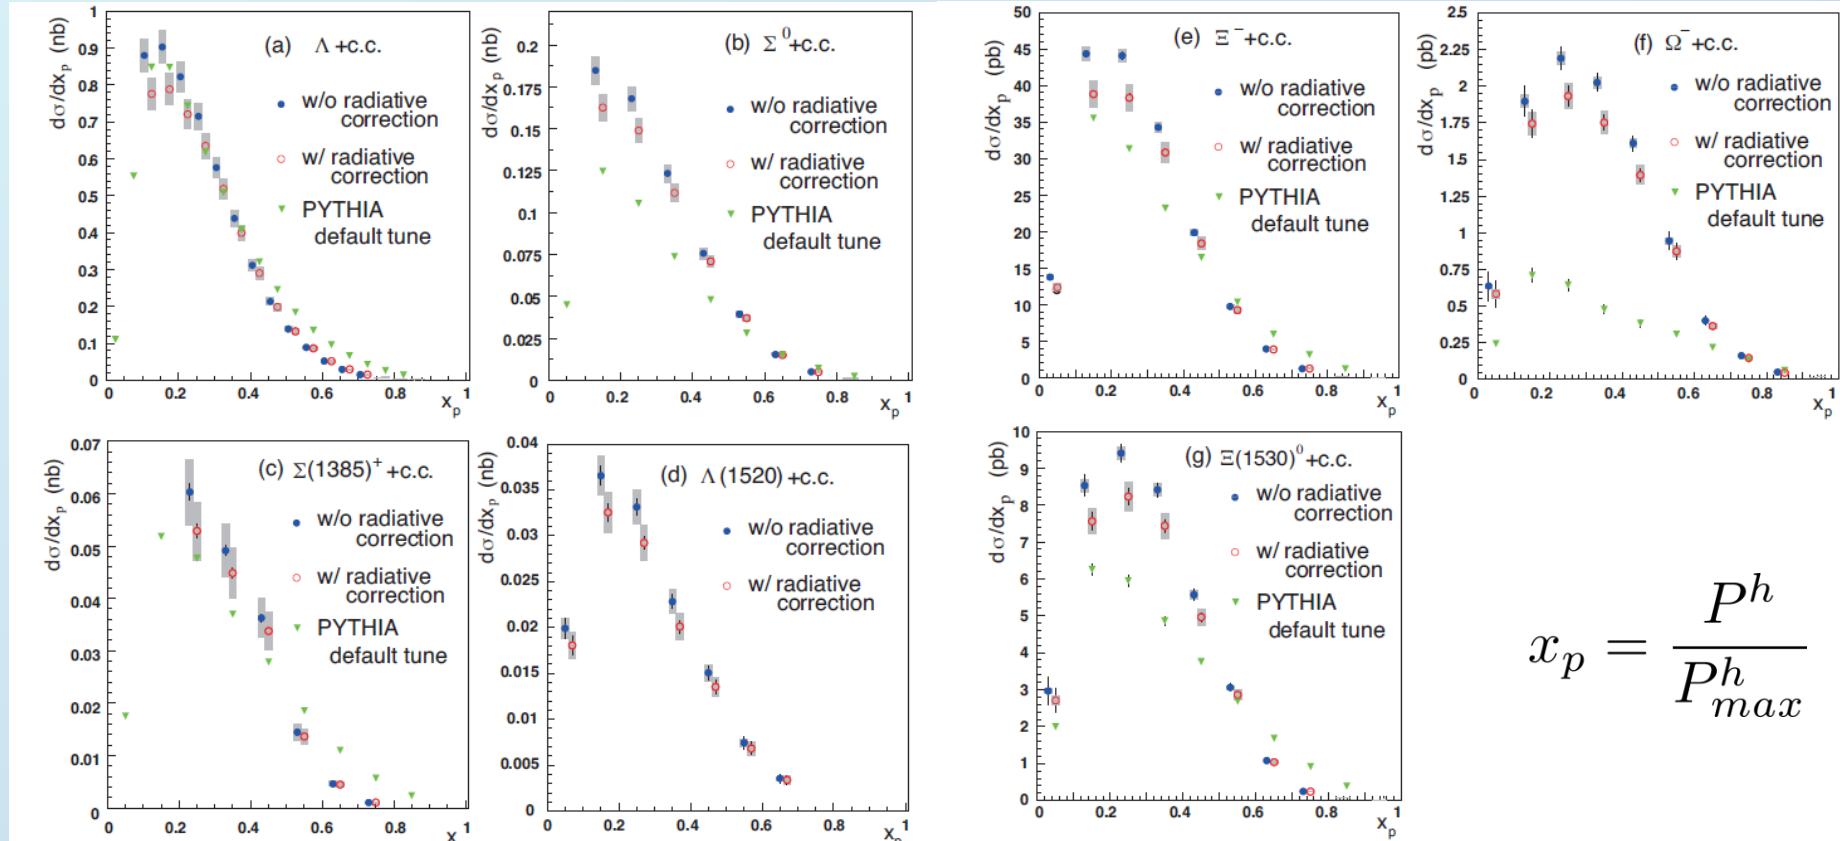

$$\mathcal{G}_{\mathbf{q}}^h(z, z_h, \omega_J R, \mathbf{j}_\perp, Q^2)$$

In  $e^+e^-$  annihilation:

$$\begin{aligned} Q &= \sqrt{s} \\ z &= \frac{2E_h}{Q} \approx \frac{E_h}{E_q} \end{aligned}$$

# Hyperon Fragmentation

Belle: Niiyama et. al. [PRD 97 \(2018\), 072005](#)

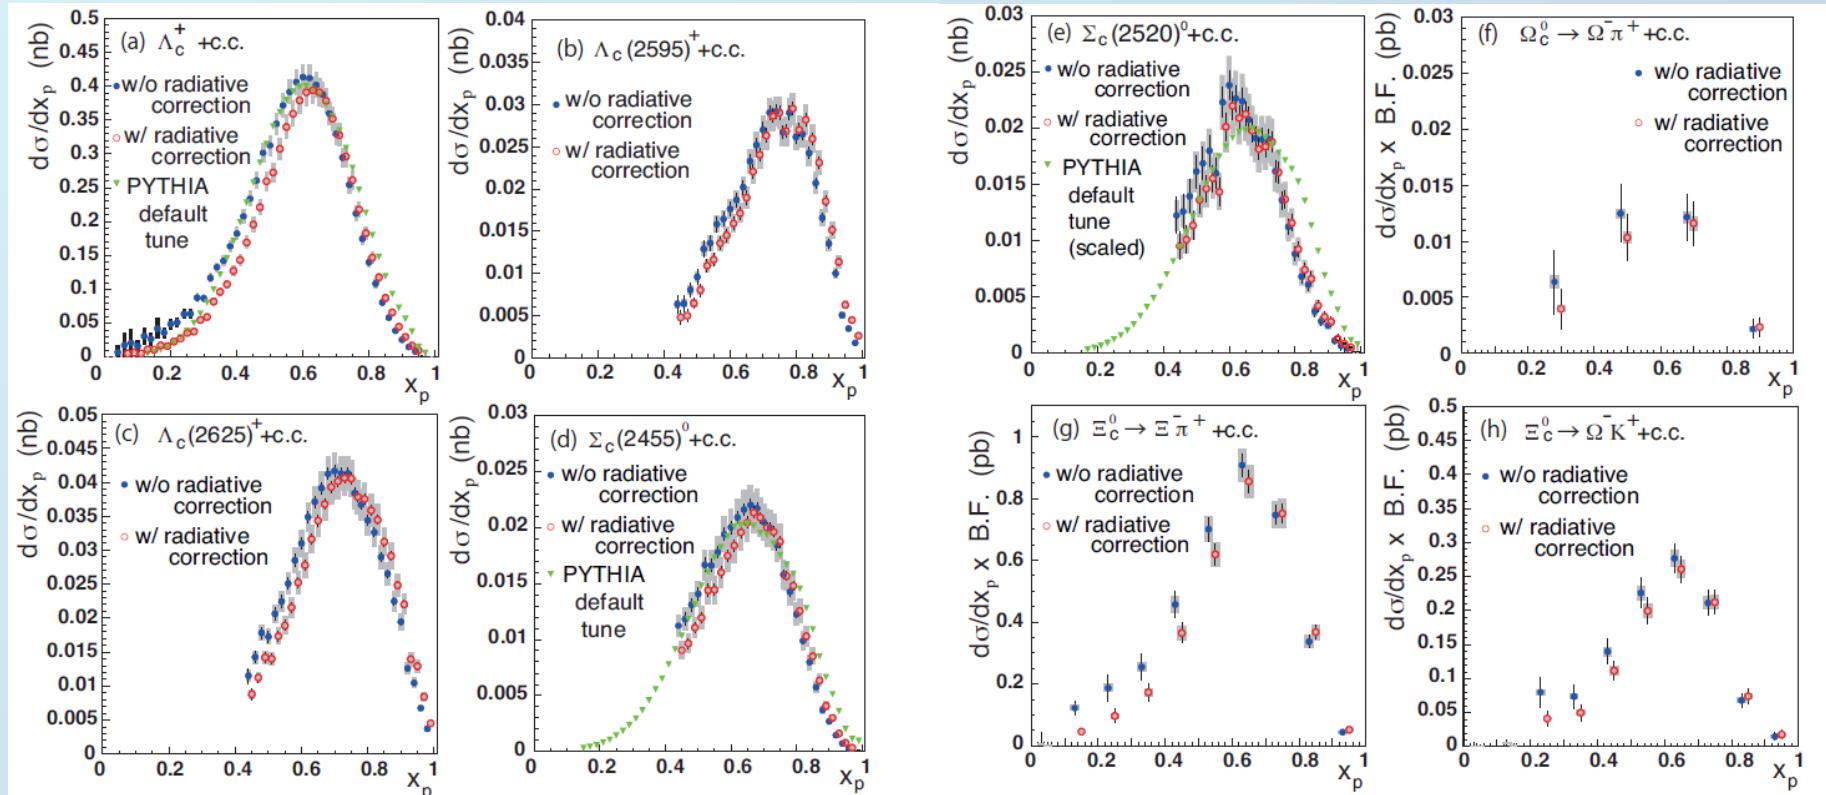

$$x_p = \frac{P^h}{P_{max}^h}$$

- Hyperons similar to light hadron fragmentation → peaking at low z ( $x_p$ )
- Baryon production not too well described by Pythia 6 default settings

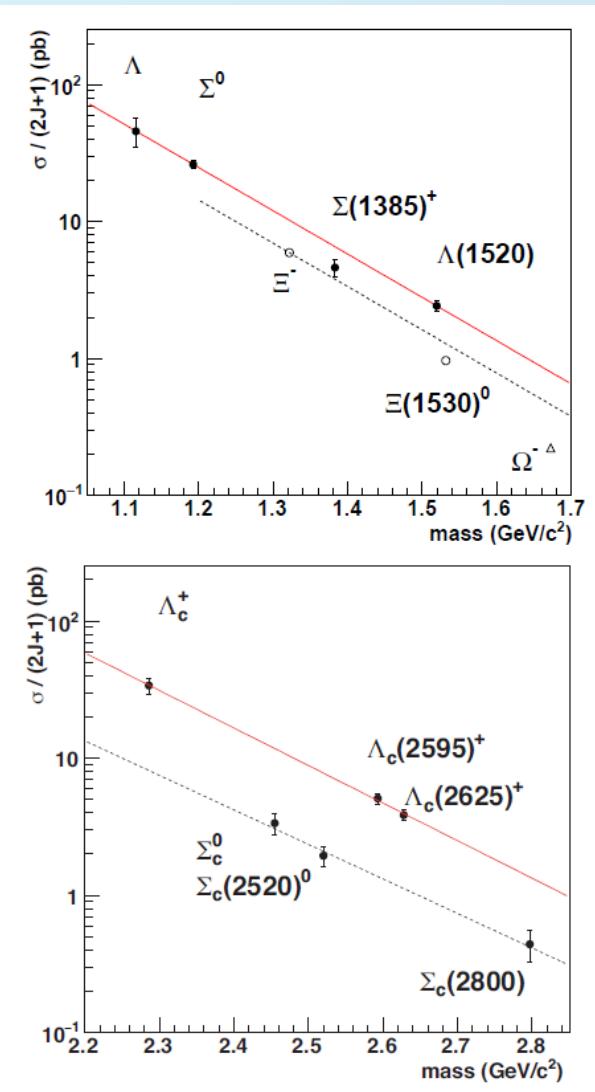

# Charmed baryon Fragmentation

Belle: Niiyama et. al. [PRD 97 \(2018\), 072005](#)

- Charmed baryons carry large fraction of parton momentum, similar to charmed mesons
- Charmed fragmentation reasonably described in Pythia for main states

# Baryon production rates

- First feed-down corrected production rates extracted
- No  $\Lambda(1520)$  enhancement seen
- Strangeness suppression seen for hyperons:

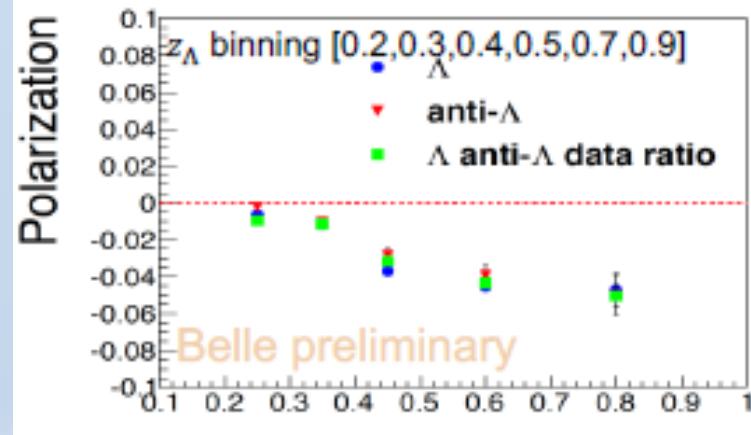

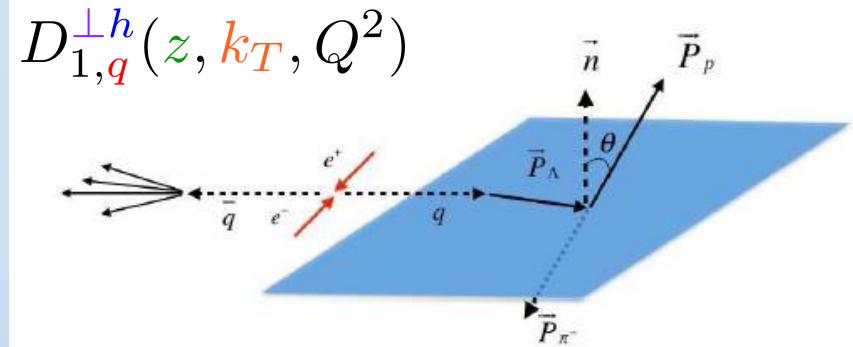

$$\frac{\sigma(S = -1)}{(2J + 1)} > \frac{\sigma(S = -2, -3)}{(2J + 1)}$$

- Difference in slopes for  $\Lambda_c$  and  $\Sigma_c$  in support of diquark production picture (spin 1 diquarks suppressed)

# Single $\Lambda$ polarization measurements

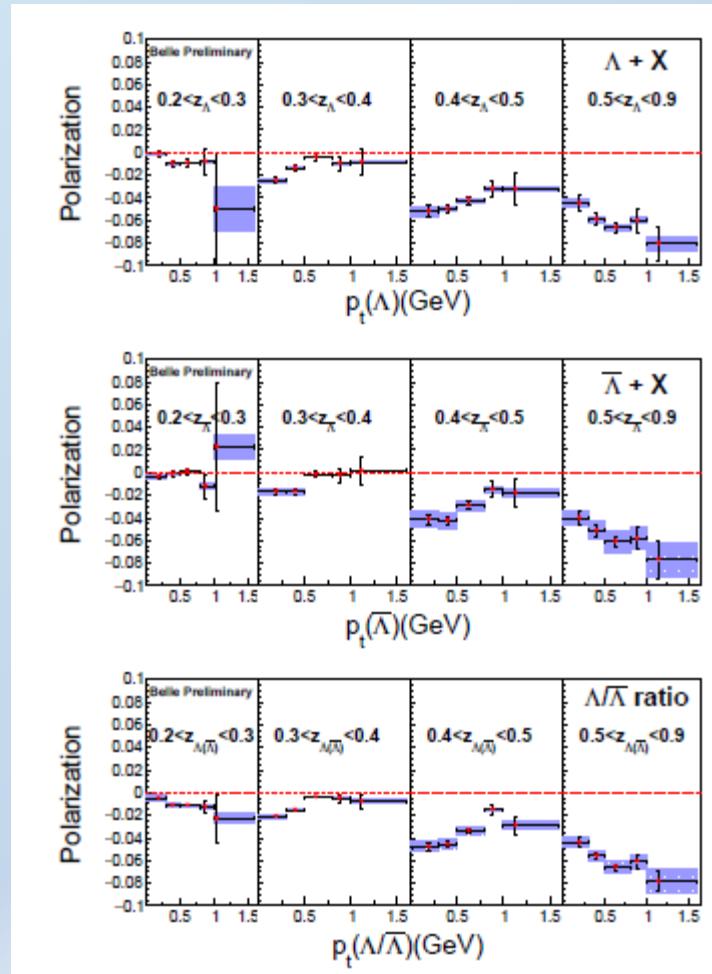

- Related to open question about  $\Lambda$  polarization in hadron collisions from 40 years ago!
- Fragmentation counterpart to the Sivers Function:
  - unpolarized parton fragments into transversely polarized baryon with transverse momentum wrt to parton direction
- Reconstruct  $\Lambda$ , its transverse momentum and polarization

YingHui Guan (Indiana/KEK):  
[arXiv:1611.06648](https://arxiv.org/abs/1611.06648)

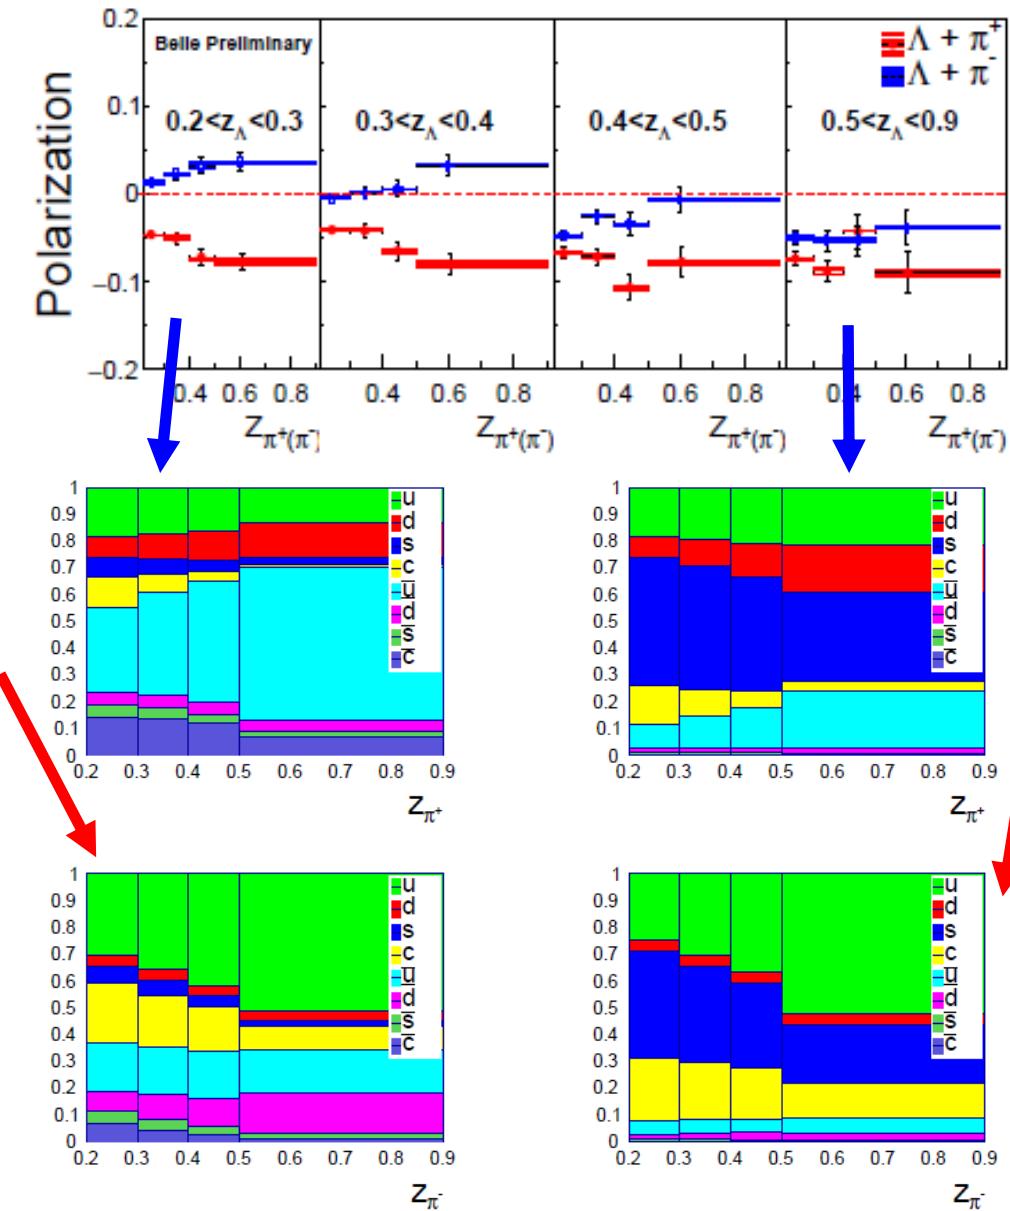

# Transverse momentum dependence

- Different behavior for low and high-z :
- At low z small
- At intermediate z falling Polarization with  $k_t$
- At high z increasing polarization with  $k_t$

# Opposite hemisphere pion correlation

- Interesting  $z_\pi$  and  $z_\Lambda$  dependence :
- At low  $z_\Lambda$  light quark fragmentation dominant, some charm in  $\pi^- \rightarrow$  different signs
- At high  $z_\Lambda$  strange + charm fragmentation more relevant  $\rightarrow$  same signs

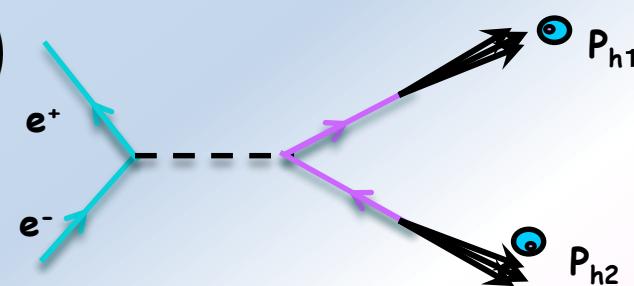

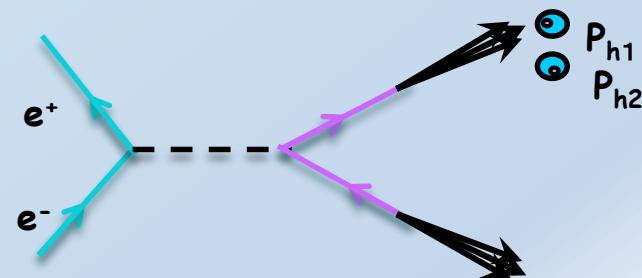

# Di-hadron fragmentation functions

$$D_{1,\textcolor{red}{q}}^{h_1 h_2}(z, m, Q^2)$$

$$H_{1,\textcolor{red}{q}}^{h_1, h_2, \leftarrow}(z, Q^2, M_h)$$

$$D_{1,\textcolor{red}{q}}^h(z_1, Q^2) D_{1,\textcolor{red}{q}}^h(z_2, Q^2)$$

In  $e^+e^-$  annihilation:

$$Q = \sqrt{s}$$
$$z = \frac{2E_h}{Q} \approx \frac{E_h}{E_q}$$

# Di-hadrons

- Single inclusive hadron multiplicities ( $e^+e^- \rightarrow hX$ ) sum over all available flavors and quarks and antiquarks:

$$d\sigma(e^+e^- \rightarrow hX)/dz \propto \sum_q e_q^2 (D_{1,q}^h(z, Q^2) + D_{1,\bar{q}}^h(z, Q^2))$$

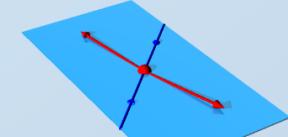

- Especially distinction between favored (ie  $u \rightarrow \pi^+$ ) and disfavored ( $\bar{u} \rightarrow \pi^+$ ) fragmentation would be important
- Idea: Use di-hadron fragmentation, preferably from opposite hemispheres and access favored and disfavored combinations:

$$u\bar{u} \rightarrow \pi^+\pi^- X \propto D_{u,fav}^{\pi^+}(z_1, Q^2) \cdot D_{\bar{u},fav}^{\pi^-}(z_2, Q^2) + D_{\bar{u},dis}^{\pi^+}(z_1, Q^2) \cdot D_{u,dis}^{\pi^-}(z_2, Q^2)$$
$$u\bar{u} \rightarrow \pi^+\pi^+ X \propto D_{u,fav}^{\pi^+}(z_1, Q^2) \cdot D_{\bar{u},dis}^{\pi^+}(z_2, Q^2) + D_{\bar{u},dis}^{\pi^+}(z_1, Q^2) \cdot D_{u,fav}^{\pi^+}(z_2, Q^2)$$

- Also: unpol baseline for interference fragmentation

# Ratios to opposite charge pion pairs

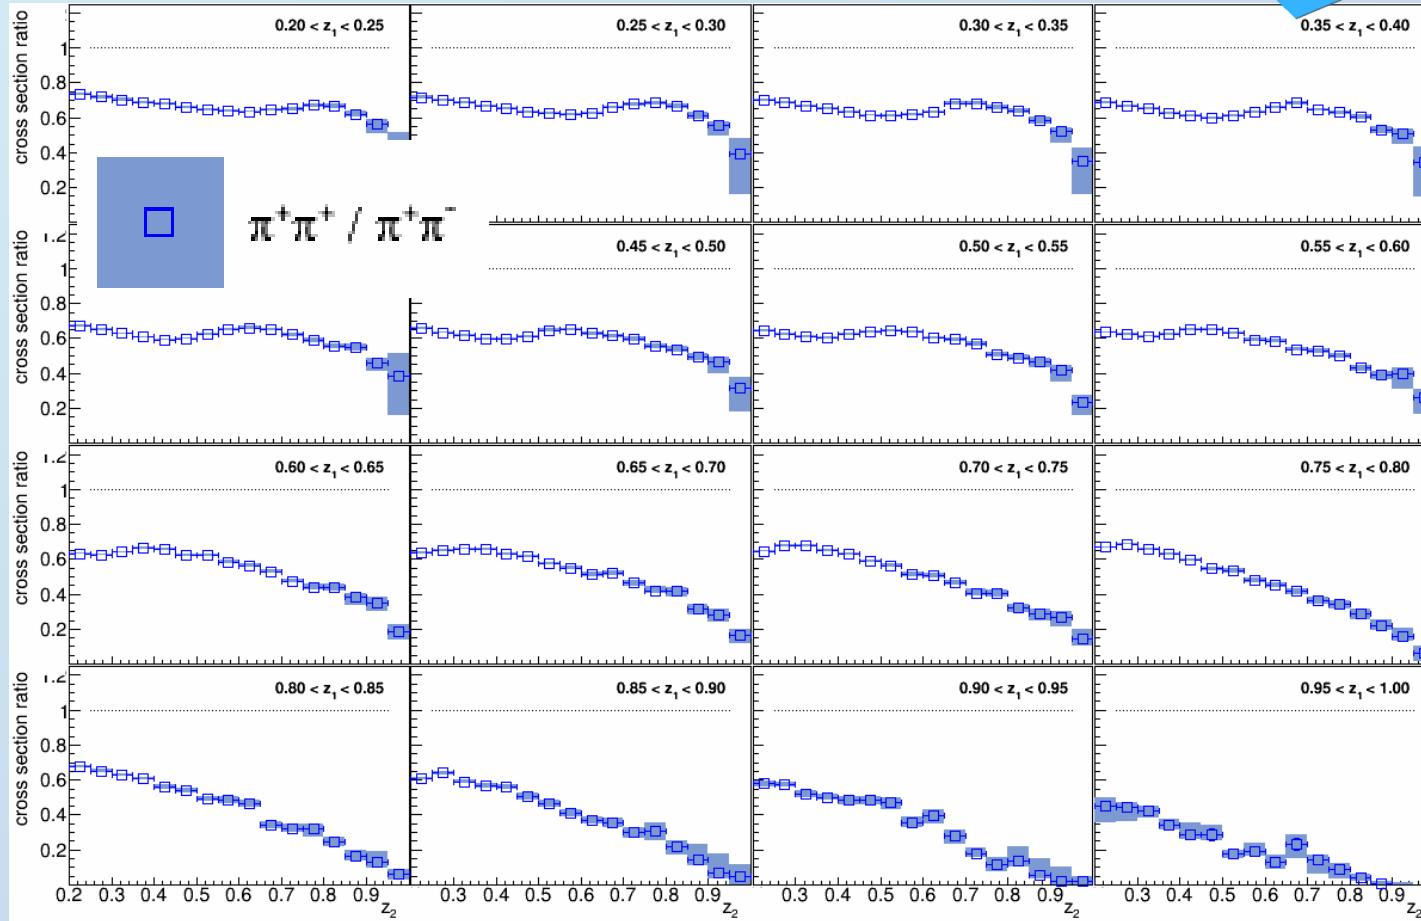

$$R \approx \frac{D_{dis}(z_1)D_{fav}(z_2) + D_{fav}(z_1)D_{dis}(z_2)}{D_{fav}(z_1)D_{fav}(z_2) + D_{dis}(z_1)D_{dis}(z_2)}$$

PRD92 (2015) 092007

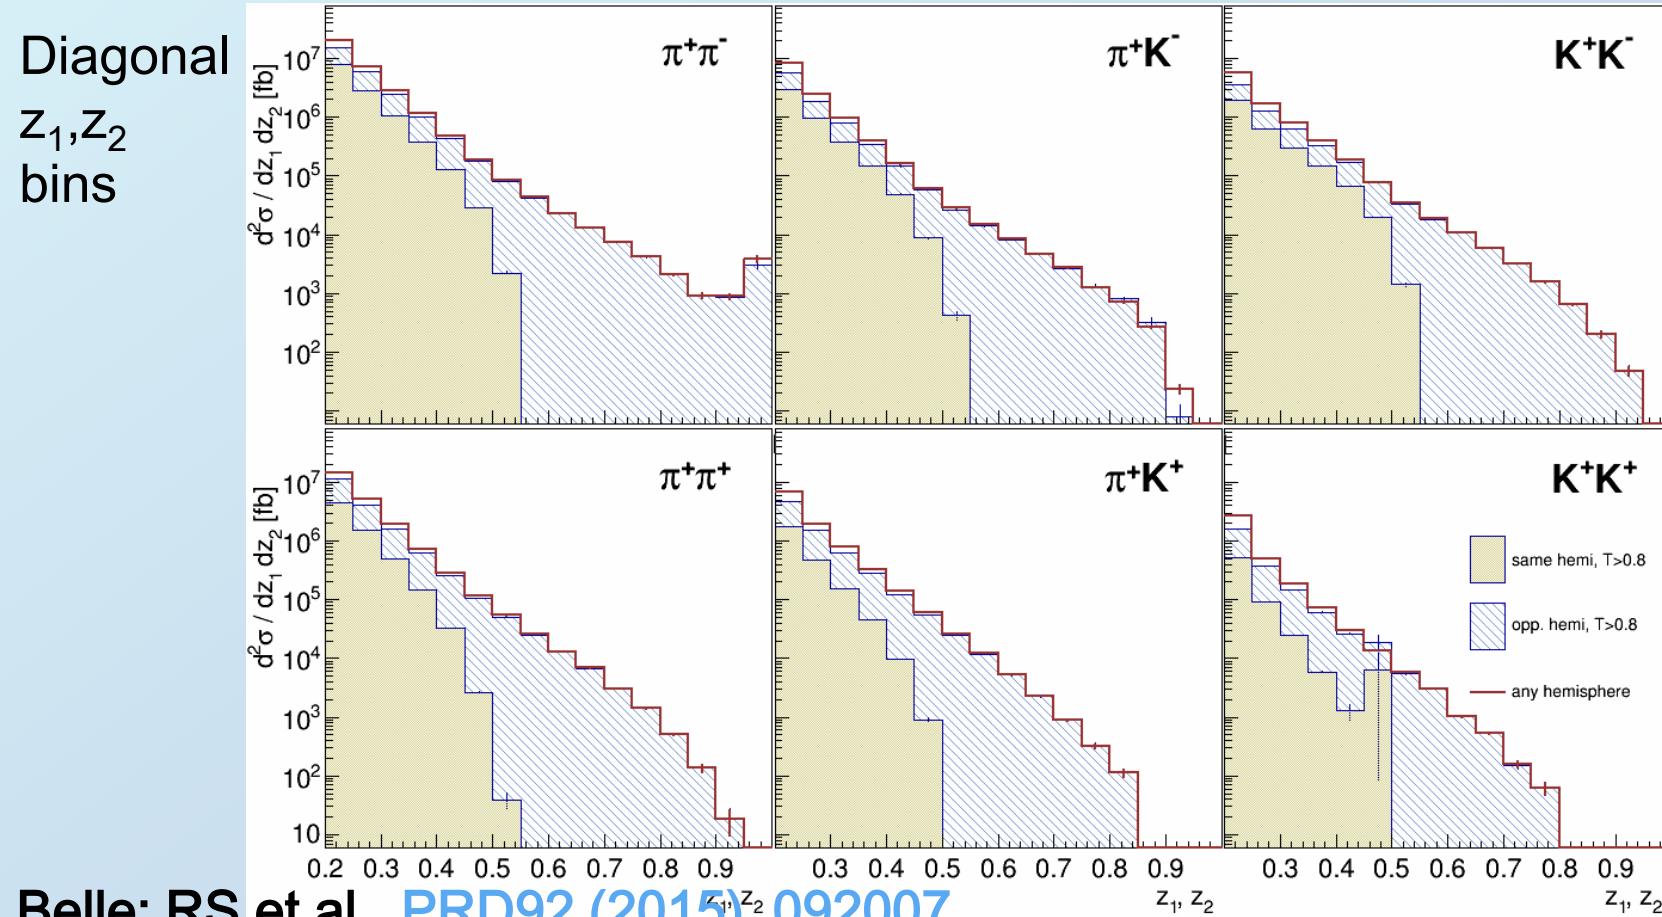

$\pi^+\pi^+$  comparable to  $\pi^+\pi^-$  at low  $z$ , decreasing towards high  $z$ :

- Favored and disfavored fragmentation similar at low  $z$
- Disfavored much smaller at high  $z$

# Hemisphere composition

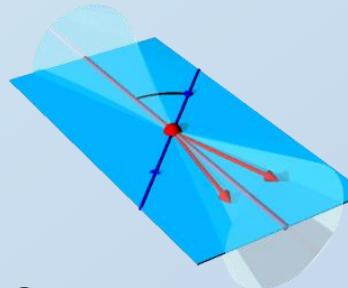

Same hemisphere contribution drops rapidly: Consistent with LO assumption of  
 Same hemisphere: single quark → di-hadron FF: ( $z_1 + z_2 < 1$ )  
 Opposite hemisphere: single quark → single hadron FF

Belle: RS et.al., [PRD92 \(2015\) 092007](#)

Systematic uncertainties not displayed  
 R.Seidl: Belle Fragmentation

# Explicit di-hadron mass dependence

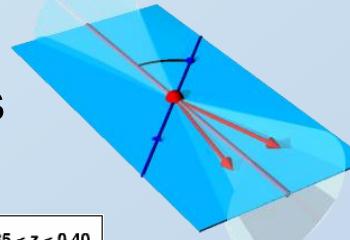

- IFF related asymmetries extracted by Belle in 2011 (PRL 107:072004(2011))
- SIDIS (JHEP 0806 (2008), PLB 713 (2012)) and RHIC ([PRL 115 \(2015\) 242501](#)) IFF asymmetries published
- Global fits currently missing unpolarized di-hadron FF baseline

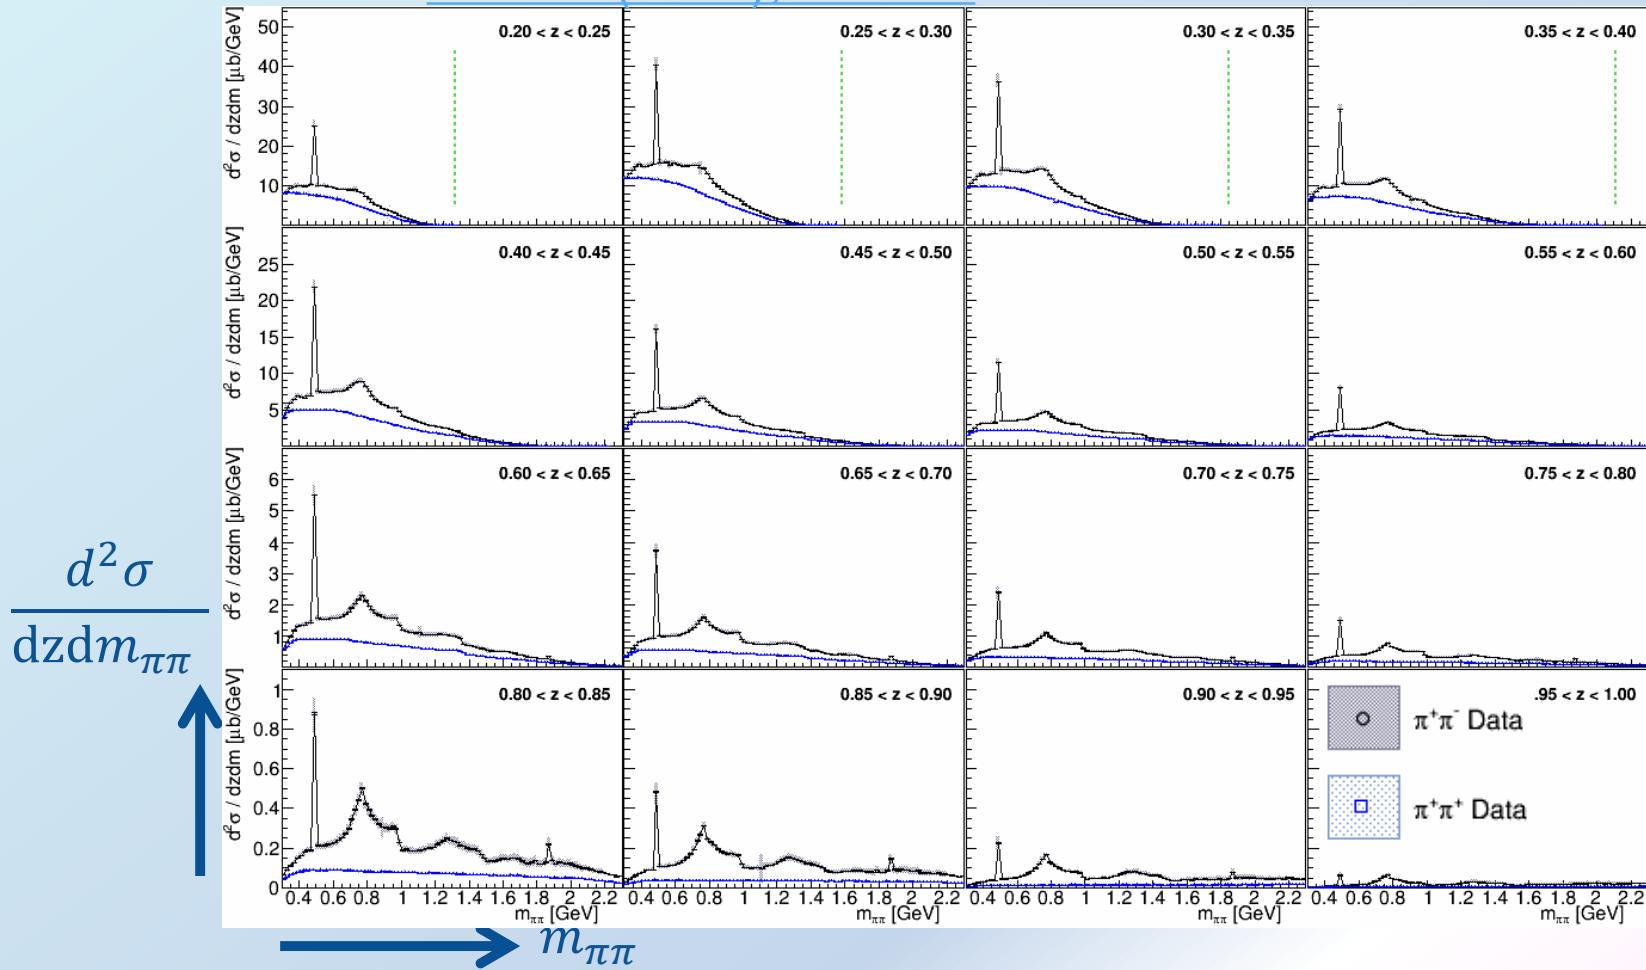

- Belle to the rescue
- Use same hemisphere di-hadrons for this analysis
  - 16 z bins between 0.2 – 1
  - 100 mass bins between 0.3 – 2.3 GeV
  - Data analysis and correction steps same as previous di-hadron analysis, except for ISR treatment

# Di-hadron mass dependence

Similar analysis in same hemisphere and mass – combined z binning. Important input for IFF based transversity global analysis

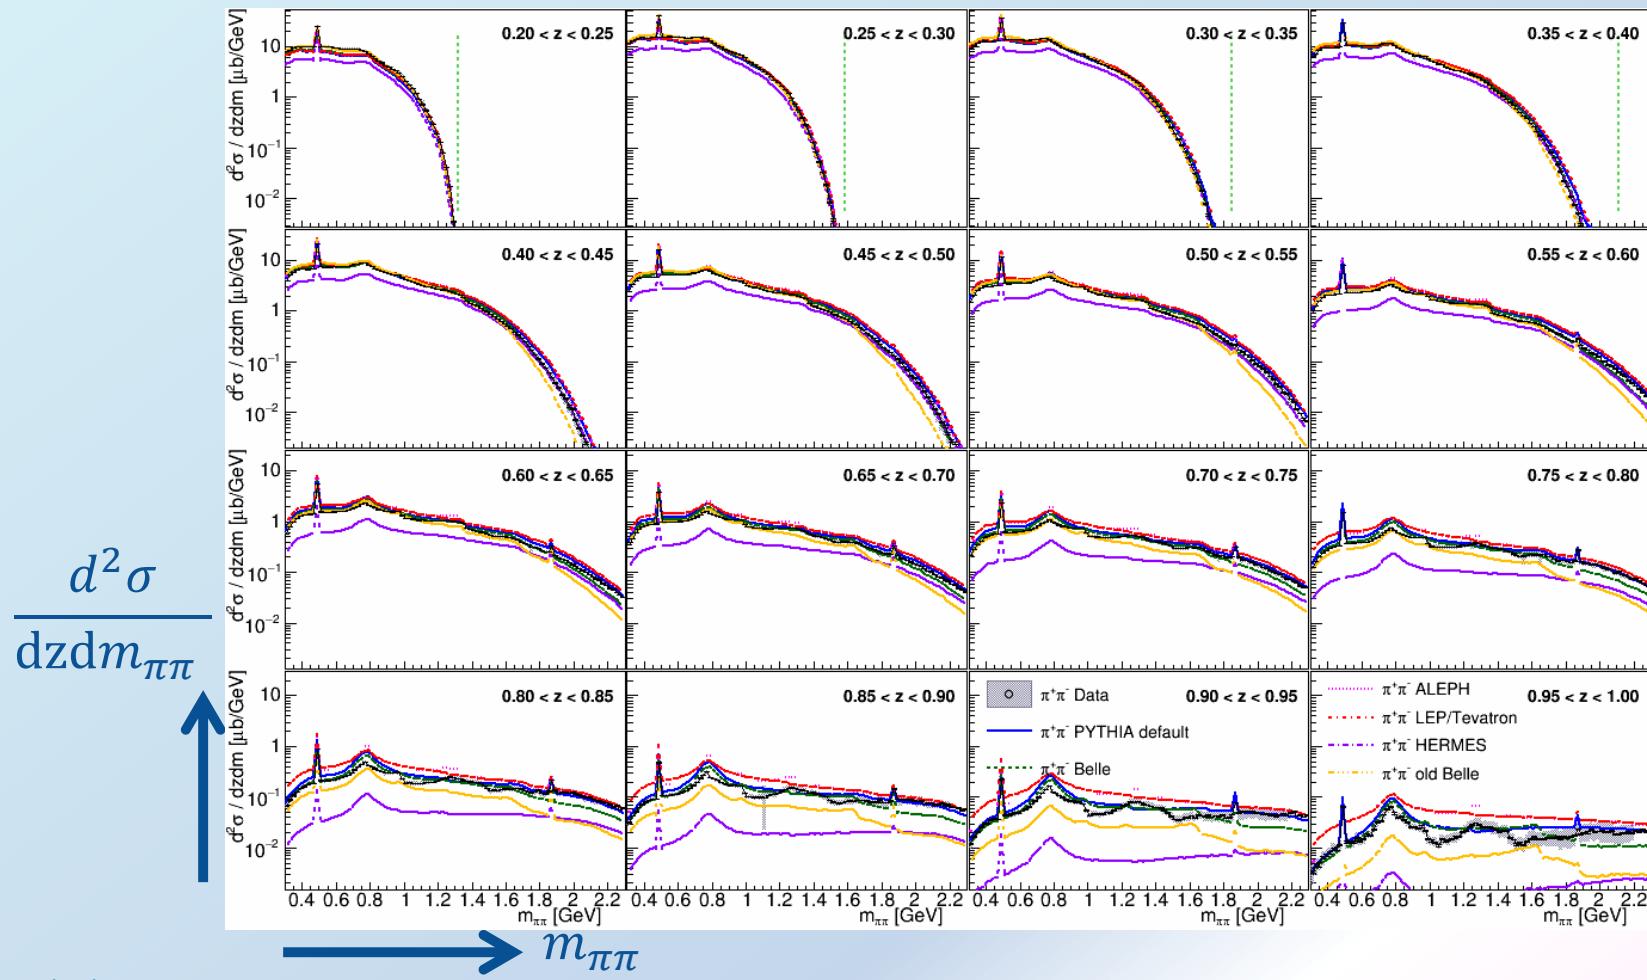

Belle: RS et.al. PRD96 (2017), 032005

# Mass dependence comparisons to Pythia tunes

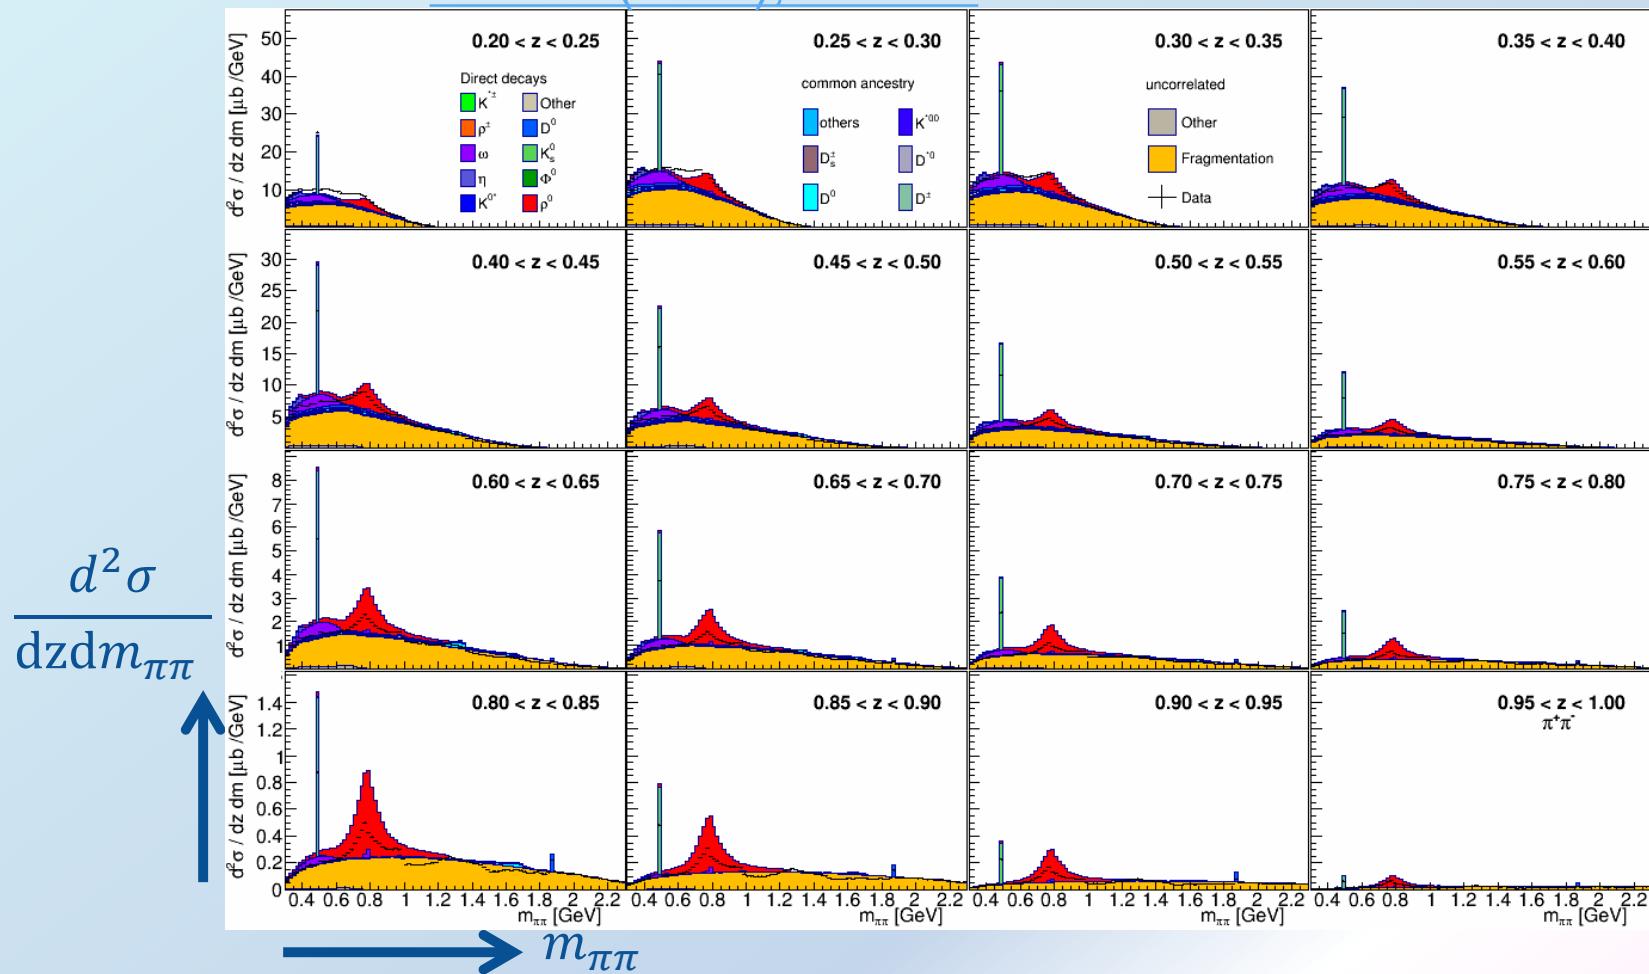

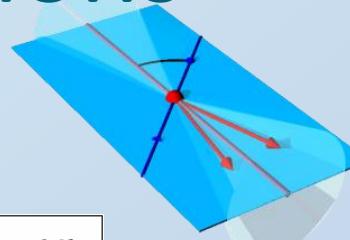

Magnitude and z dependence reasonable in Pythia 6.4 default,  
Intermediate mass structure better described by LEP tunes (higher spin mesons)

# Di-pion individual contributions

Contributions from various resonances and direct fragmentation

Belle: RS et.al. PRD96 (2017), 032005

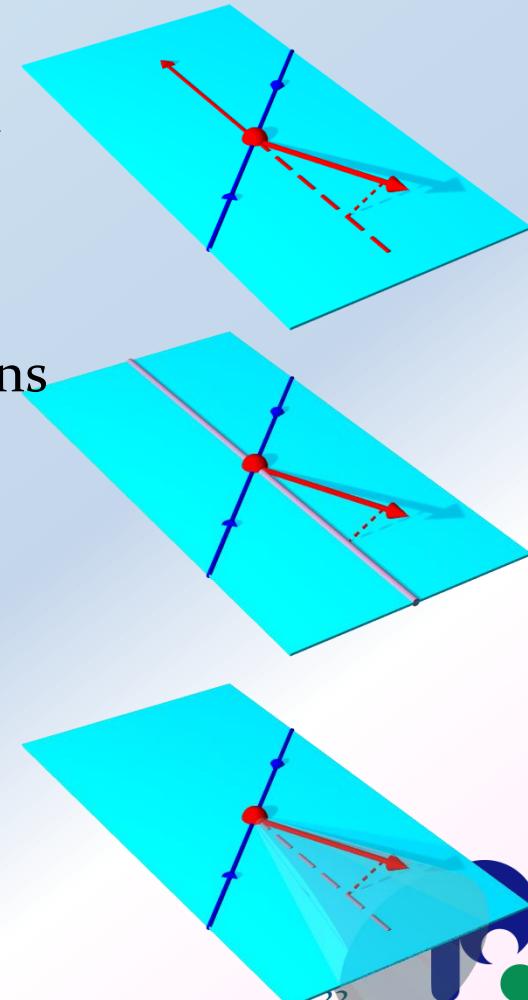

# Transverse momentum dependence

Aka un-integrated PDFs and FFs

$$D_{1,q}^h(z, Q^2, k_t)$$

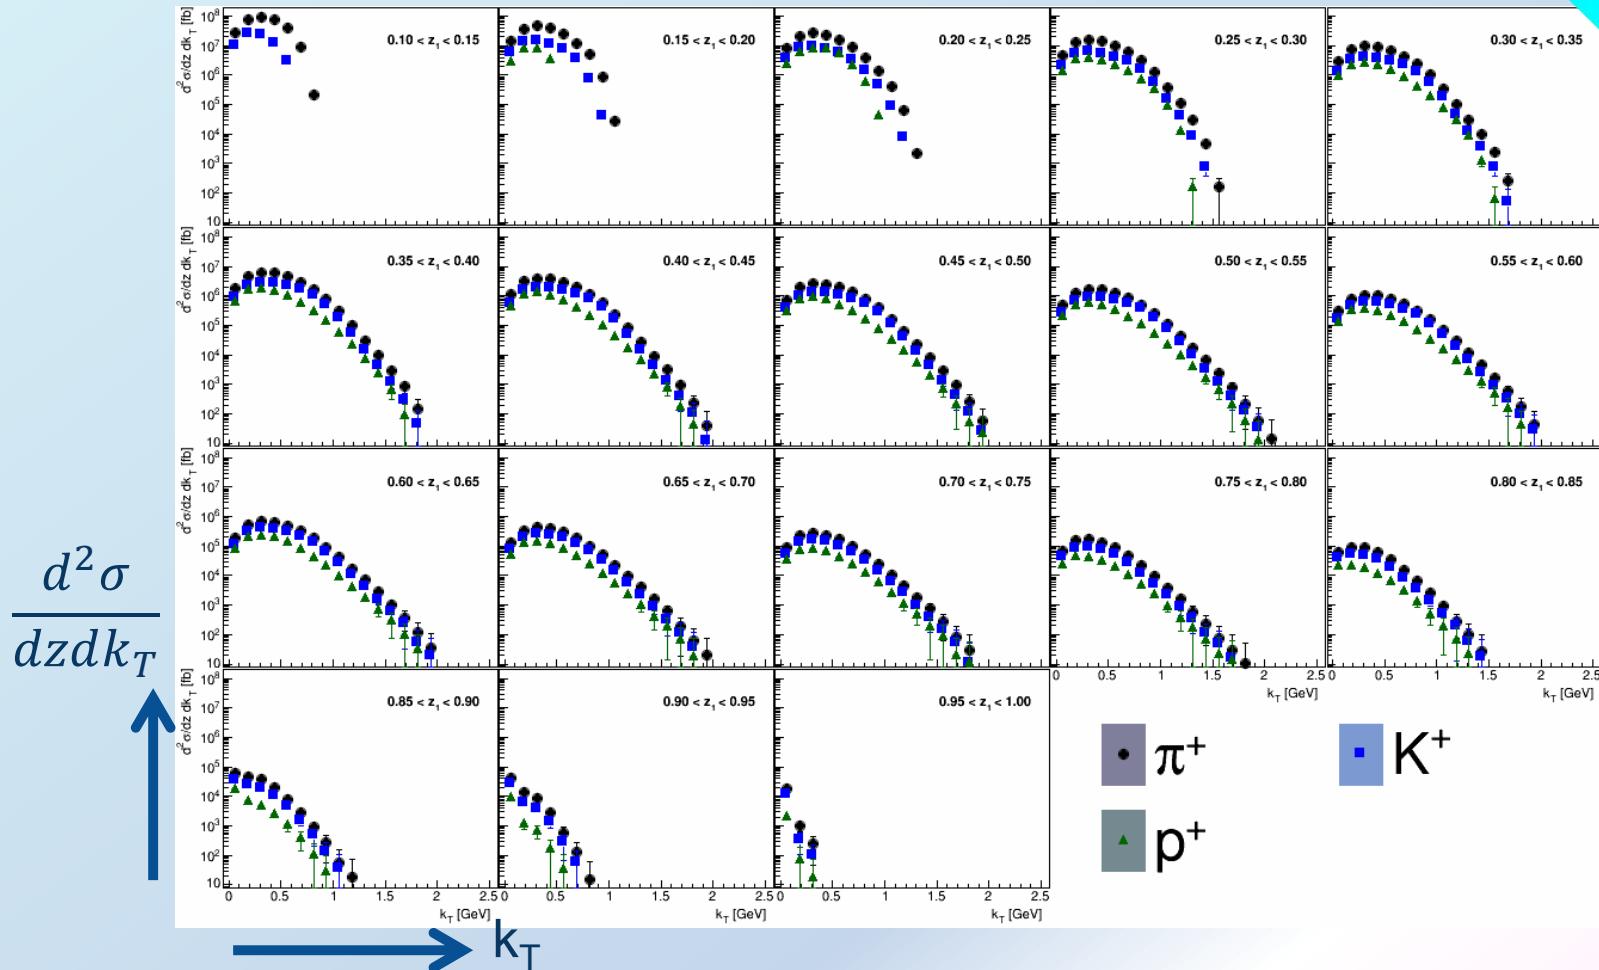

# $K_T$ Dependence of FFs in e+e-

- Gain also sensitivity into transverse momentum generated in fragmentation
- Two ways to obtain transverse momentum dependence
  - Traditional **2-hadron** FF
    - use transverse momentum between two hadrons (in opposite hemispheres)
    - Usual convolution of two transverse momenta
  - Single-hadron FF wrt to **Thrust** or jet axis
    - No convolution
    - Need correction for  $q\bar{q}$  axis

# MC sample for various hadrons

## MC simulation

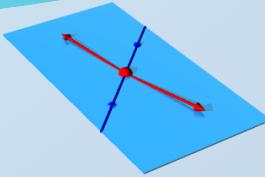

# Summary and outlook

- Hyperon and charmed baryon fragmentation measurements just published, support for diquark picture in charm FF
- Nonzero Lambda polarization measured, interesting flavor dependence
- Di-hadron fragmentation functions measured, important input for di-hadron related Transversity/Tensor charge extractions
- Transverse momentum dependent fragmentation analysis ongoing
- Other results being finalized as well ( $\eta, \pi^0$  Collins)

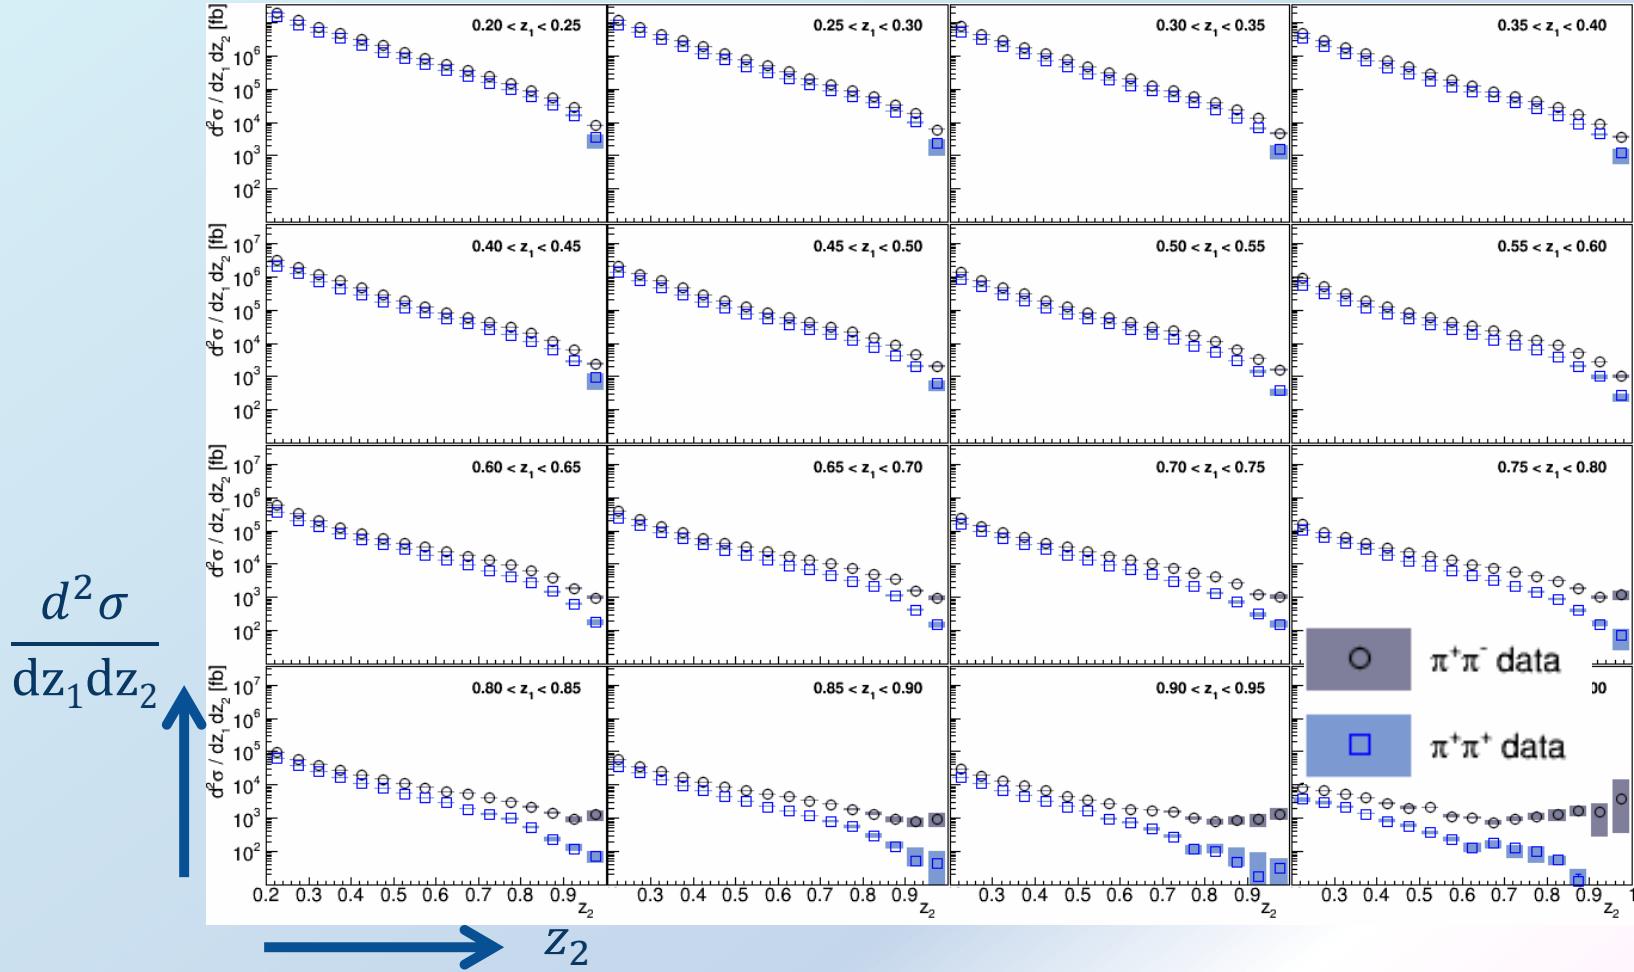

# Full results for pion pairs

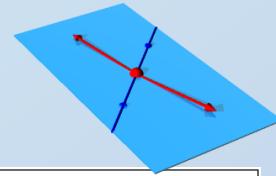

[PRD92 \(2015\) 092007](#)

Pion pair example in any topology combination shown here

# Results for diagonal $z_1 z_2$ bins

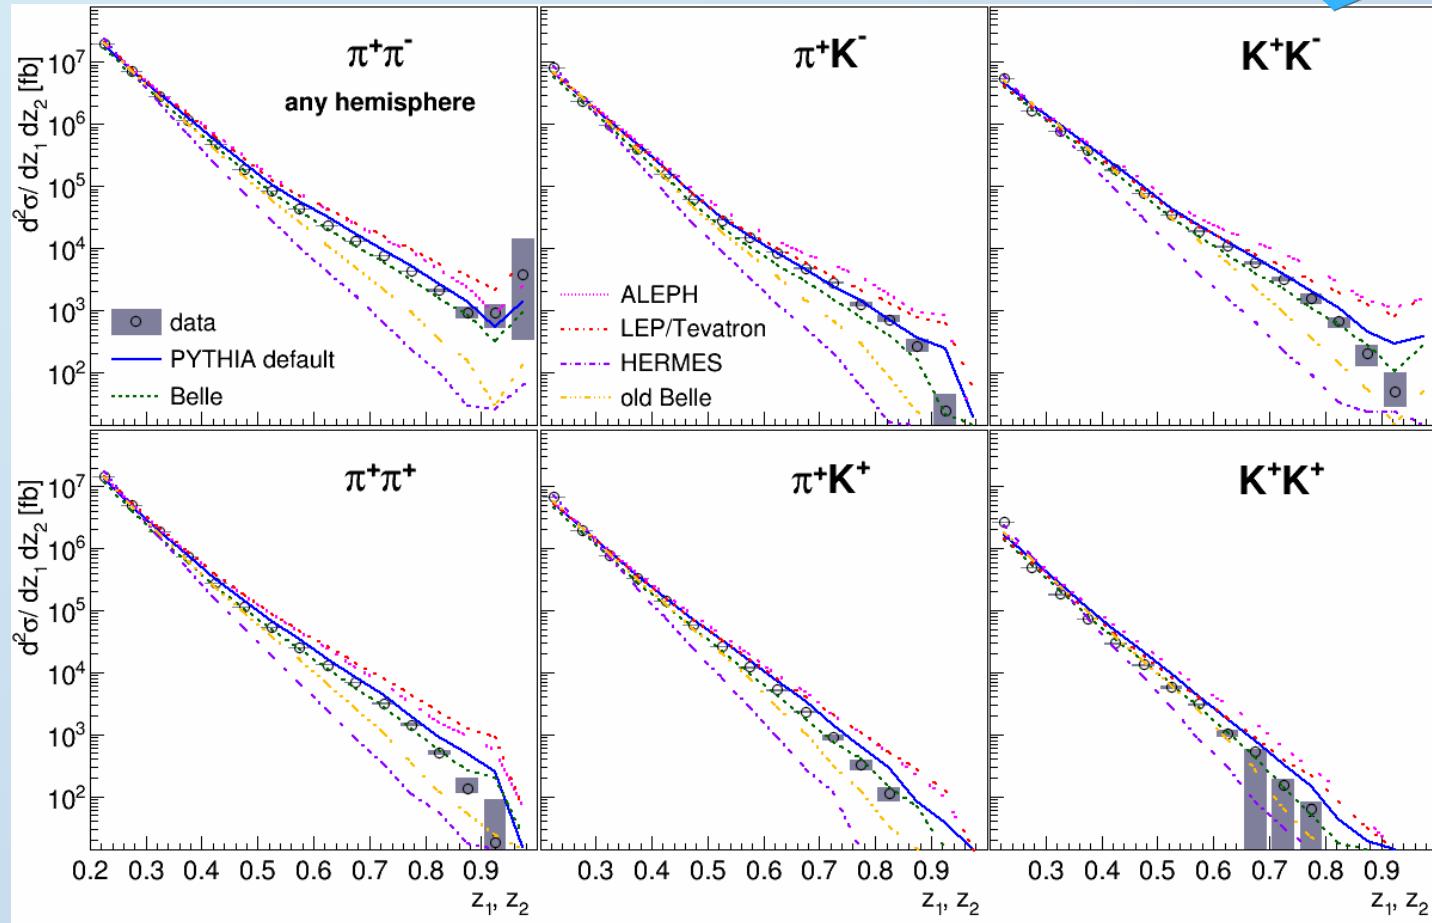

Low  $z$  dominates integral:  
→ Well defined,  
all tunes agree

[PRD92 \(2015\) 092007](#)

Diagonal  $z_1, z_2$  bins

High  $z$  not well measured,  
especially at  
Belle energies:  
→ large spread in  
tunes

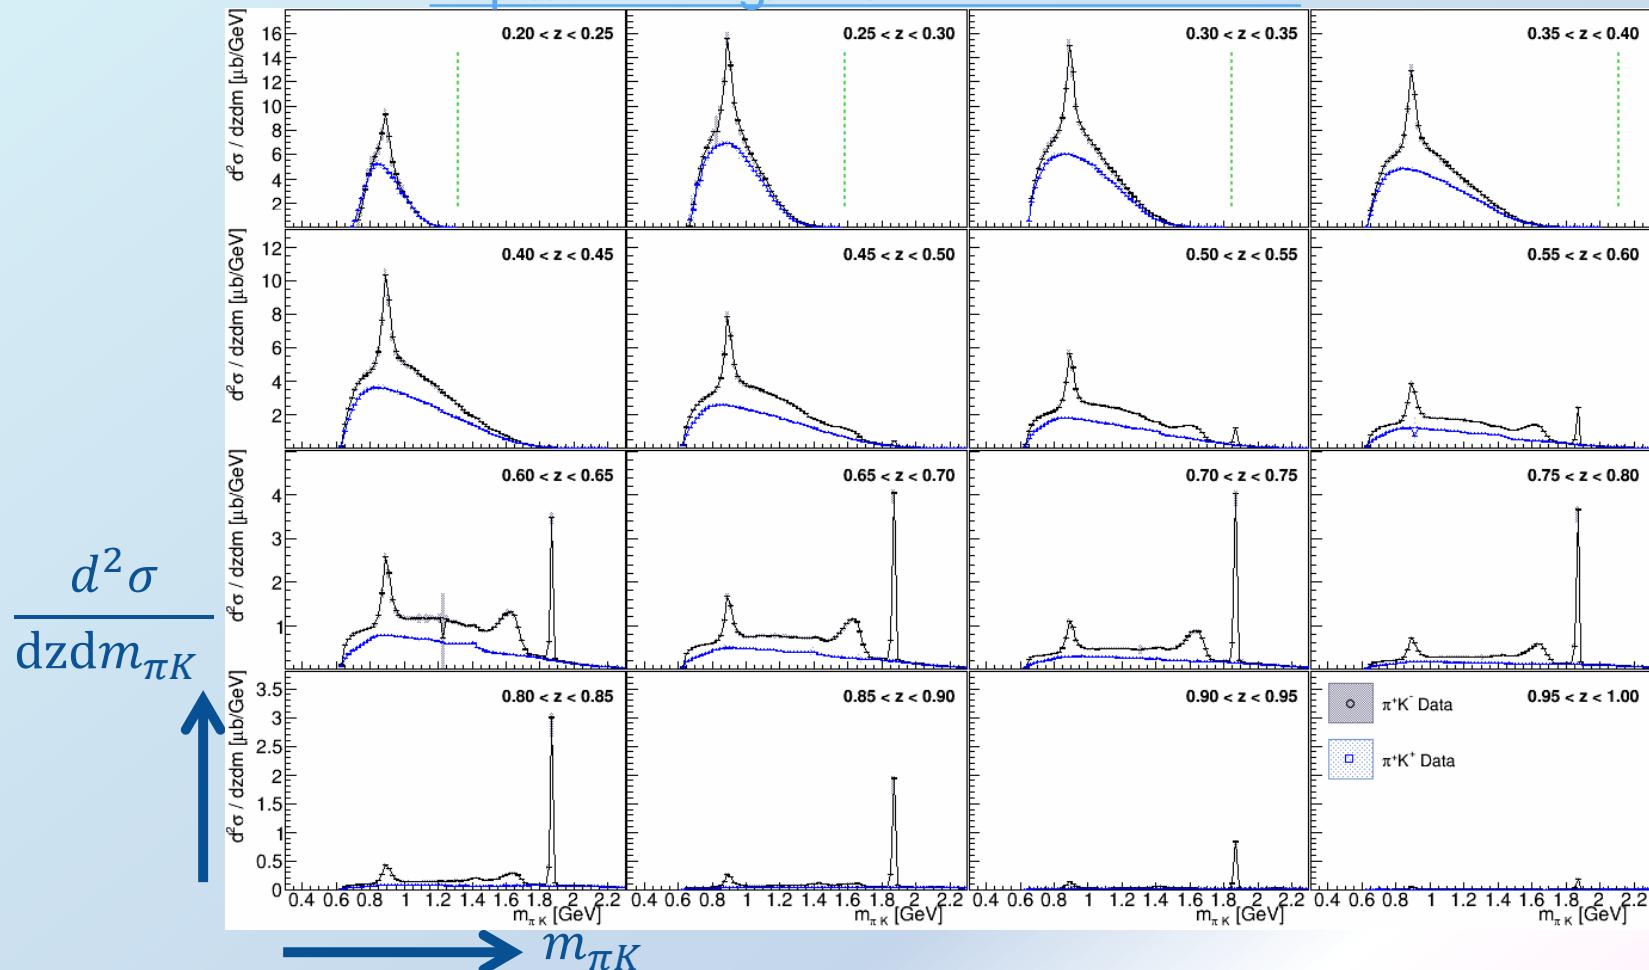

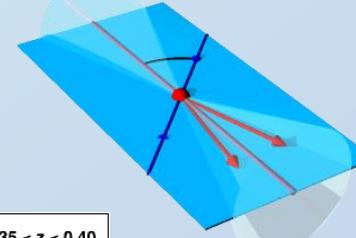

Default Pythia  
settings and  
current Belle  
setting with good  
agreement

# Di-hadron mass dependence

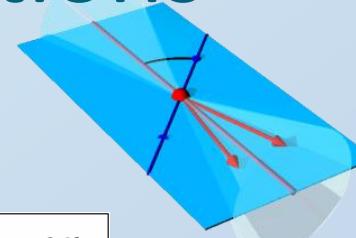

Pion – kaon pairs

Belle: RS et.al. <http://arxiv.org/abs/arXiv:1706.08348>

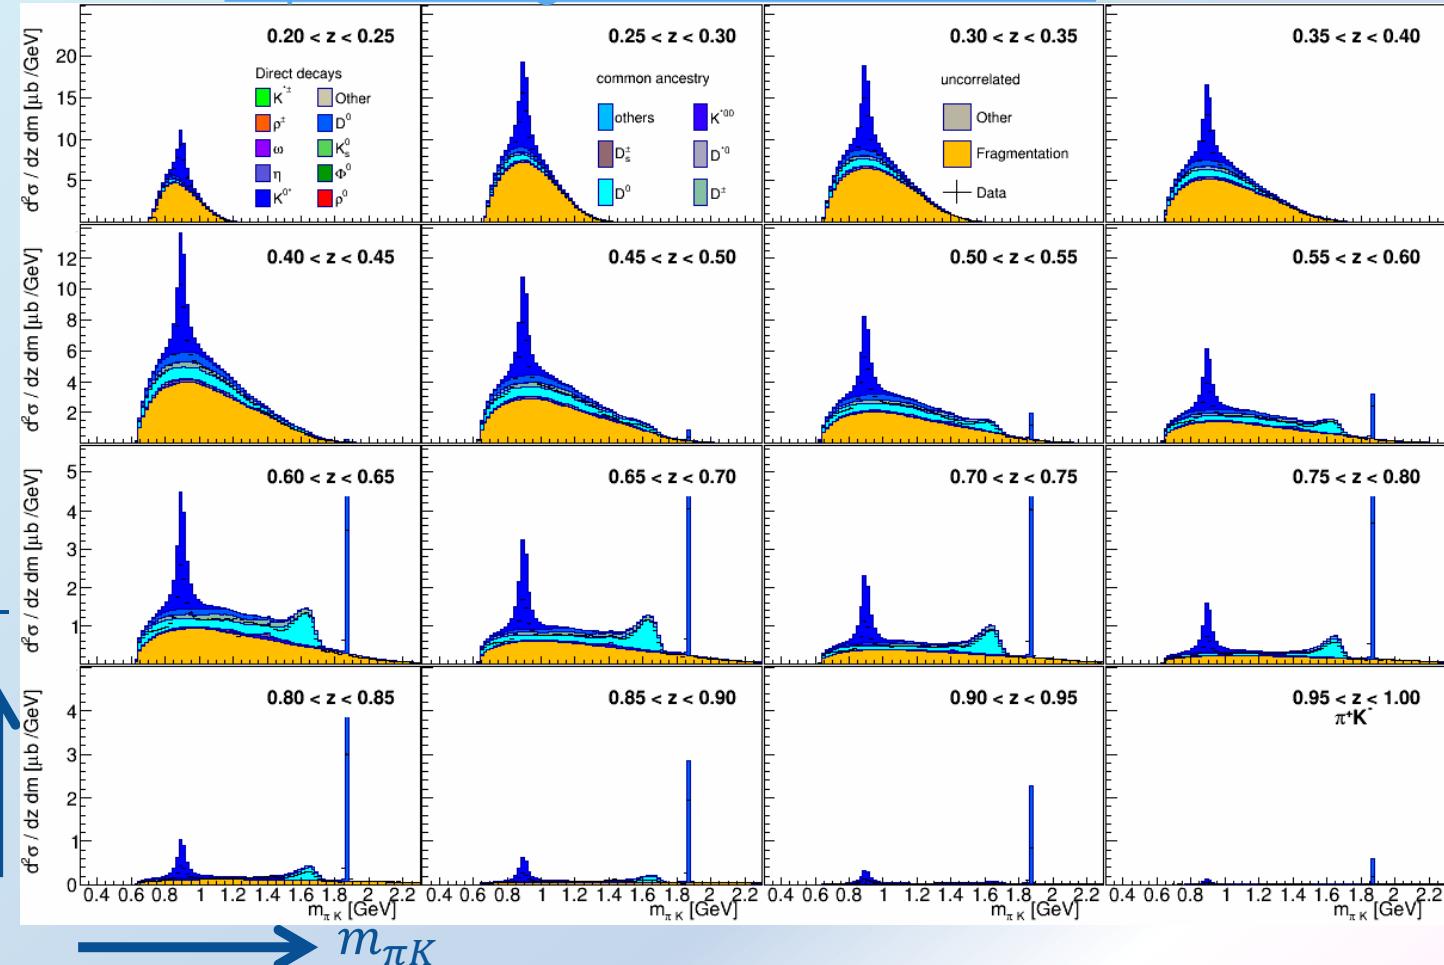

# Pion-kaon individual contributions

Belle: RS et.al. <http://arxiv.org/abs/arXiv:1706.08348>

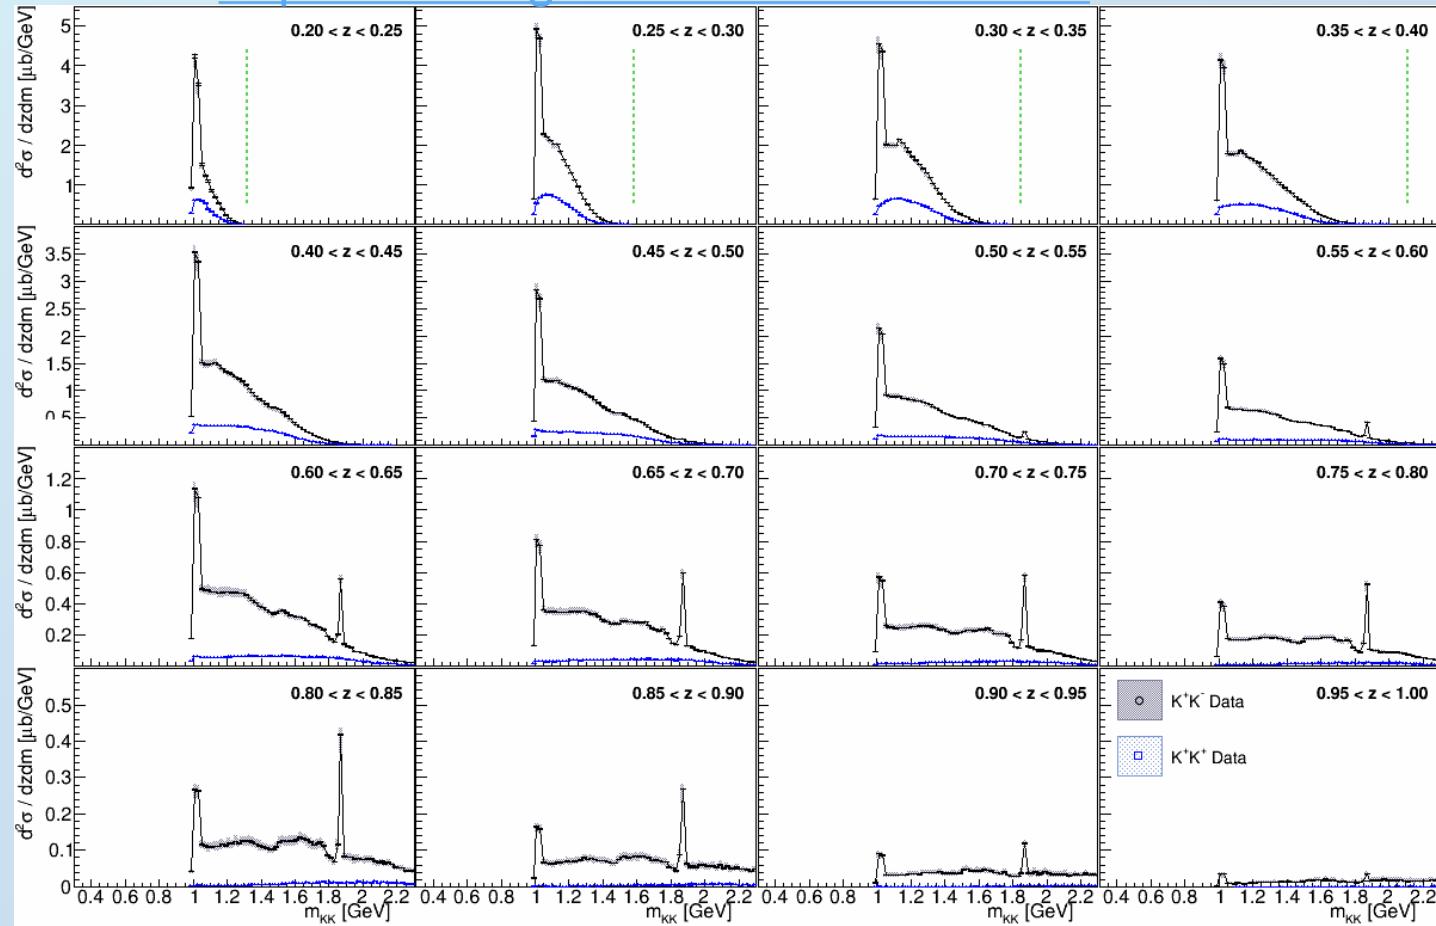

$$\frac{d^2\sigma}{dz dm_{\pi K}}$$

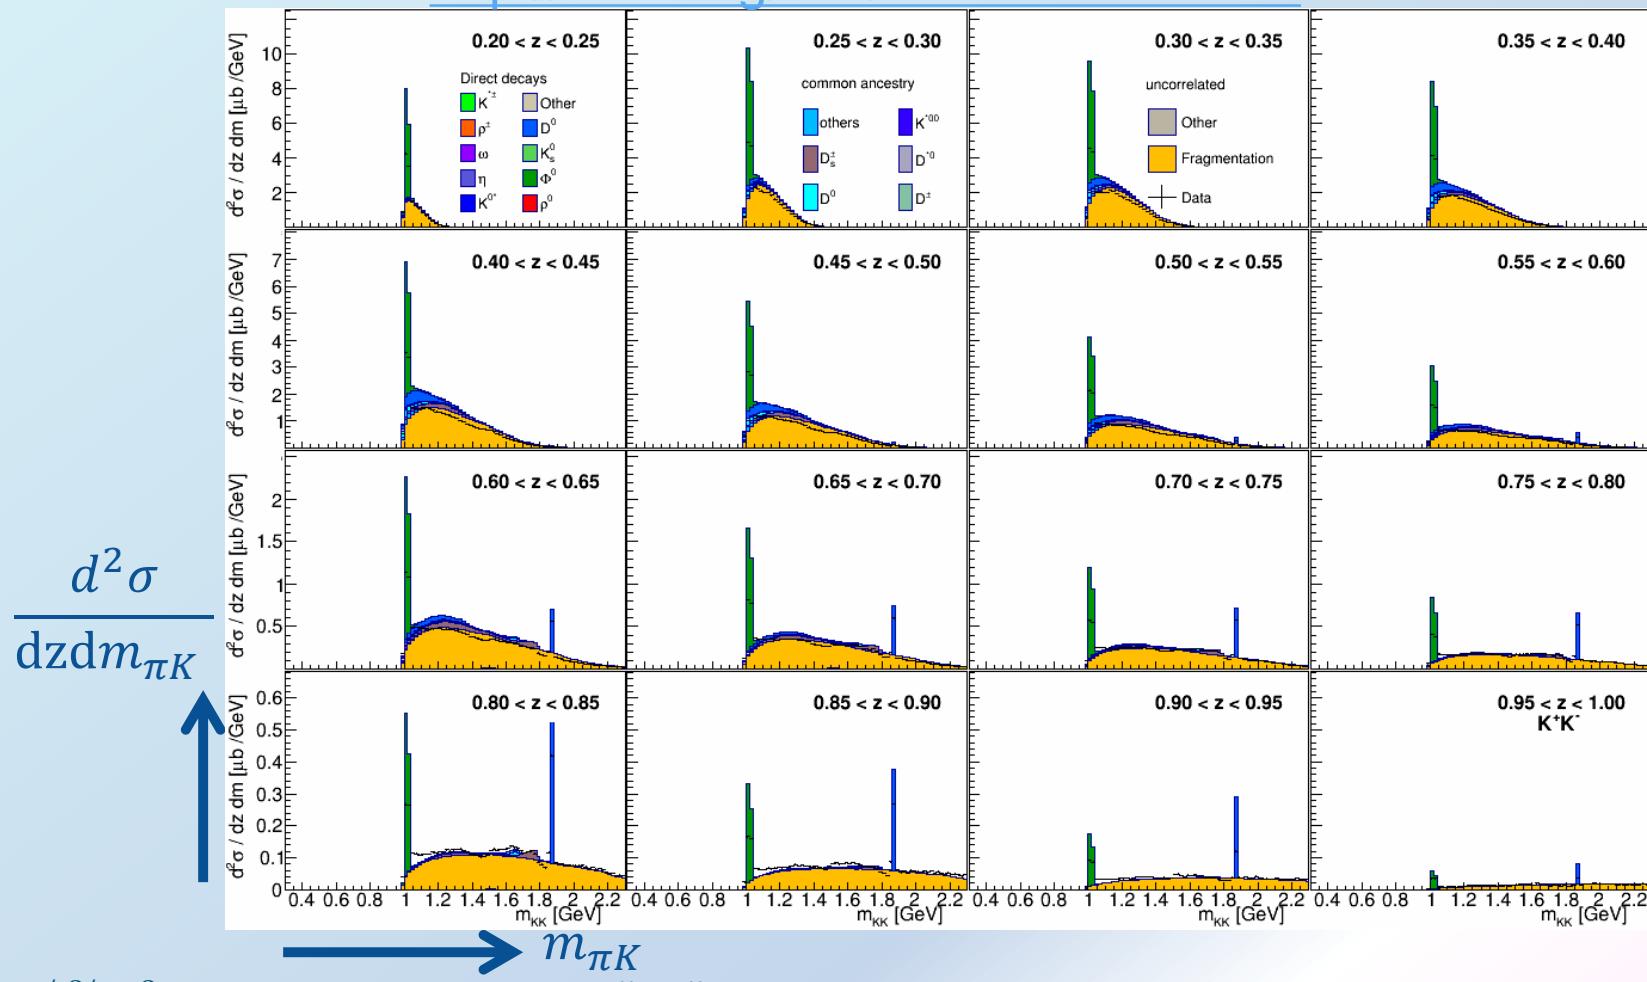

# Kaon pairs

Belle: RS et.al. <http://arxiv.org/abs/arXiv:1706.08348>

# Kaon-kaon individual contributions

Belle: RS et.al. <http://arxiv.org/abs/arXiv:1706.08348>

# Differences in Pythia/JetSet settings

PARJ(47) :	modification of Lund fragmentation for heavy quarks with Bowler, bottom
PARJ(54) :	charm fragmentation functional form and value if MSTJ(11) = 2 or 3
PARJ(55) :	bottom fragmentation functional form and value if MSTJ(11) = 2 or 3
PARJ(81) :	$\Lambda_{QCD}$ for parton showers
PARJ(82) :	Invariant mass cut-off for parton showers

# Di-hadron fragmentation functions

$$D_{1,\textcolor{red}{q}}^{h_1 h_2}(z, m, Q^2)$$

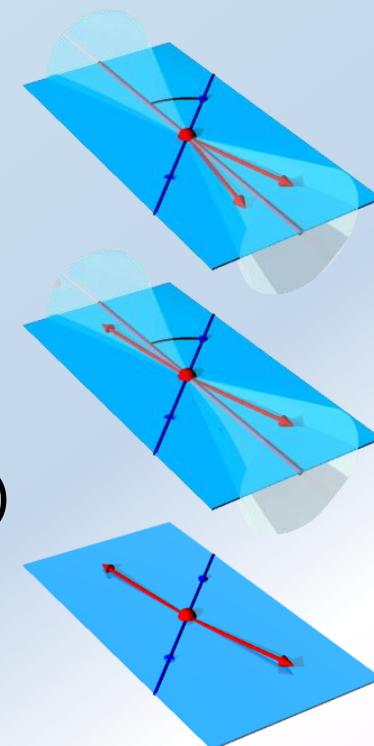

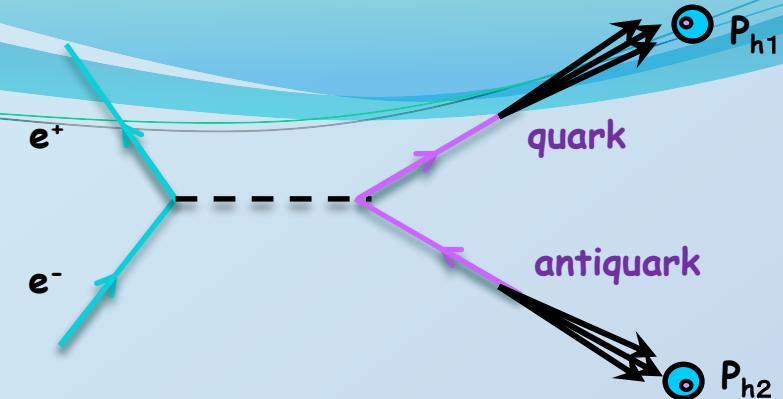

$$D_{1,\textcolor{red}{q}}^h(z_1, Q^2) D_{1,\textcolor{red}{q}}^h(z_2, Q^2)$$

# Setup

- Generally look at  $4 \times 4$  hadron combinations ( $\pi, K, +, -$ )
  - Keep separate until end: only 6 independent yields
- 3 hemisphere combinations:
  - same hemisphere (thrust  $>0.8$ )
  - opposite hemisphere ( thrust  $>0.8$  )
  - any combination ( no thrust selection)
- $16 \times 16 z_1 z_2$  binning between 0.2 - 1

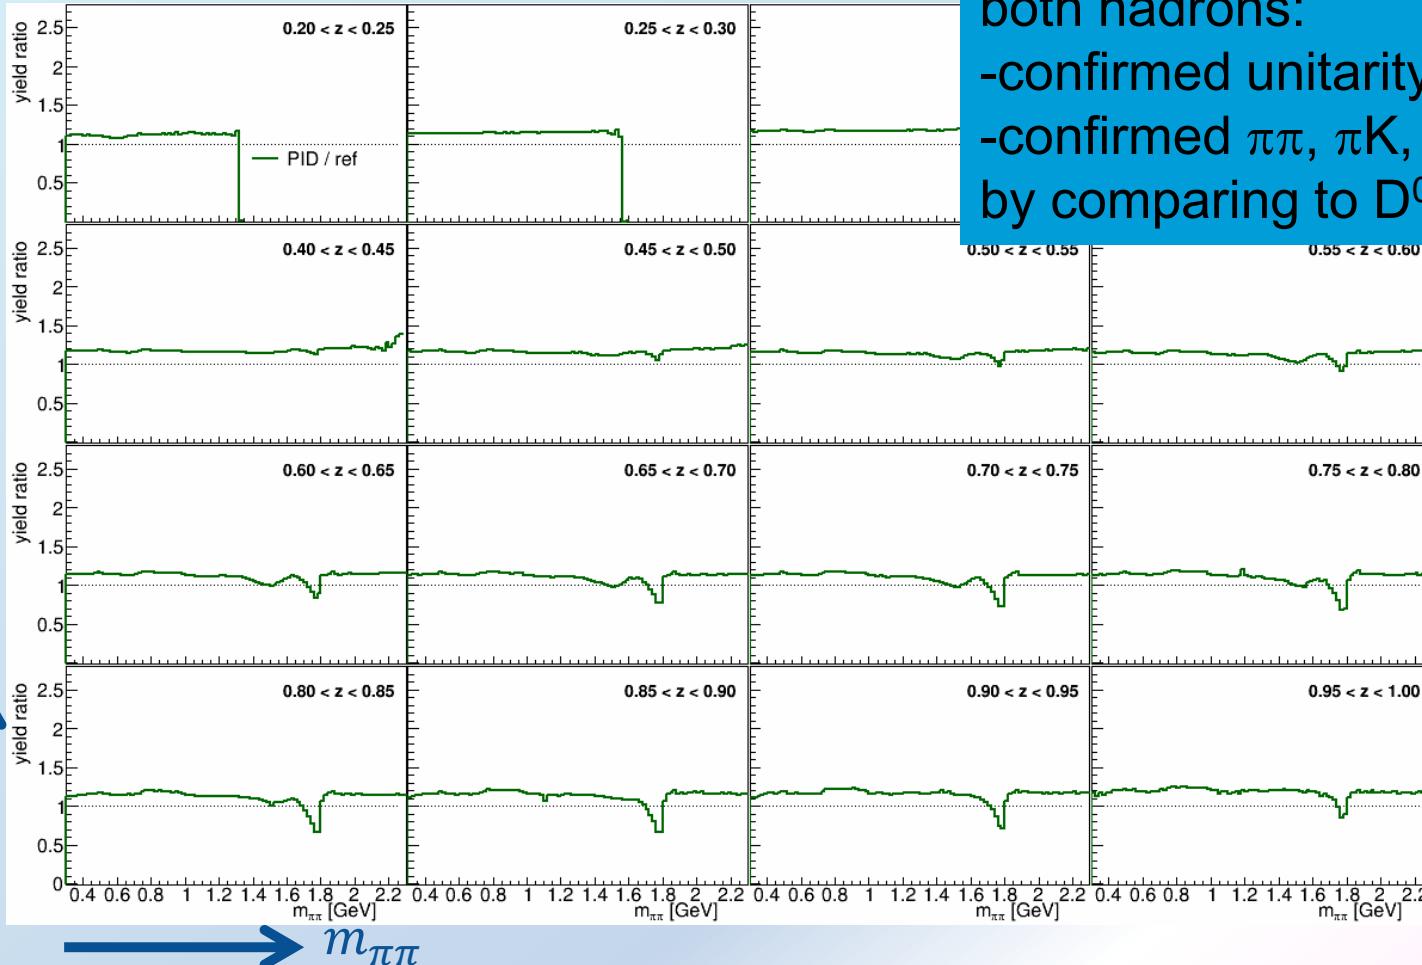

# Correction chain

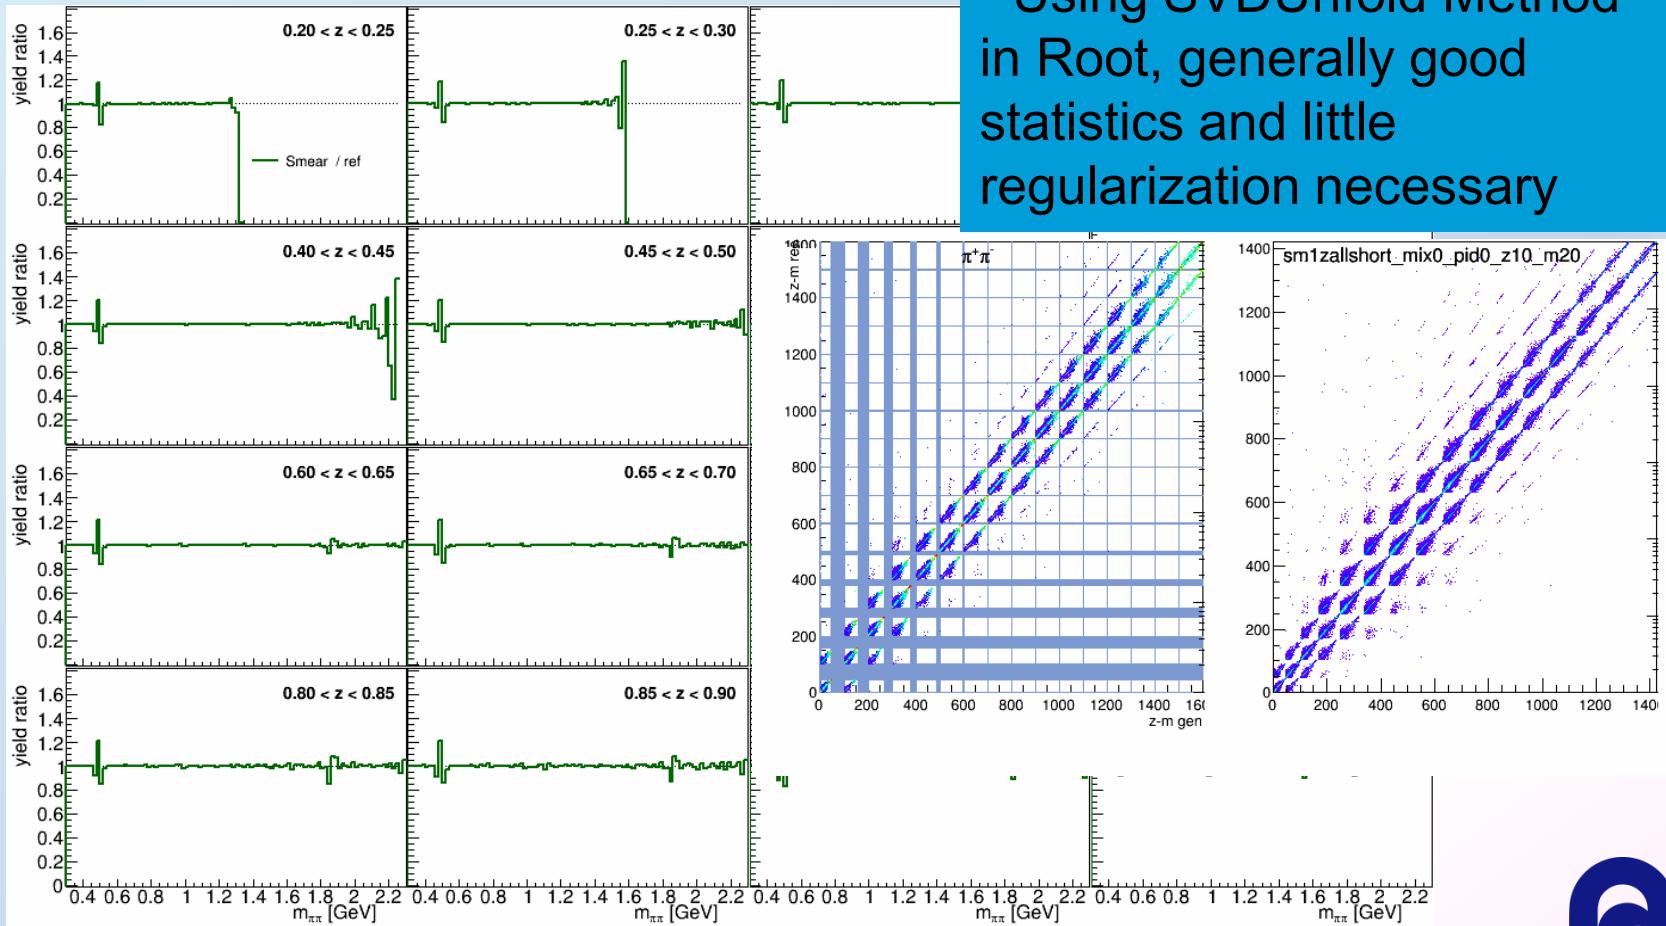

Correction	Method	Systematics
PID mis-id	PID matrices (5x5 for $\cos \theta_{\text{lab}}$ and $p_{\text{lab}}$ )	MC sampling of inverted matrix element uncertainties, variation of PID correction method
Momentum smearing	MC based smearing matrices (1600x1600), SVD unfold	SVD unfolding vs analytically inverted matrix, reorganized binning, MC statistics
Non-qqbar BG removal	eeuu, eess, eecc, tau MC subtraction	Variation of size, MC statistics
Acceptance I (cut efficiency)	In barrel reconstructed vs udsc generated in barrel	MC statistics
Acceptance II	udsc Gen MC barrel to $4\pi$	MC statistics, variation in tunes
Weak decay removal (optional)	udcs check evt record for weak decays	Compare to other Pythia settings
ISR	ISR on vs ISR off in Pythia	Variations in tunes

# PID correction

Using Martin Leitgab's  
 5x5 PID matrices in fine  $17 \times 9 P_{\text{lab}} \times \cos\theta_{\text{lab}}$  binning for  
 both hadrons:  
 -confirmed unitarity  
 -confirmed  $\pi\pi$ ,  $\pi K$ ,  $KK$  yields  
 by comparing to  $D^0$  BRs

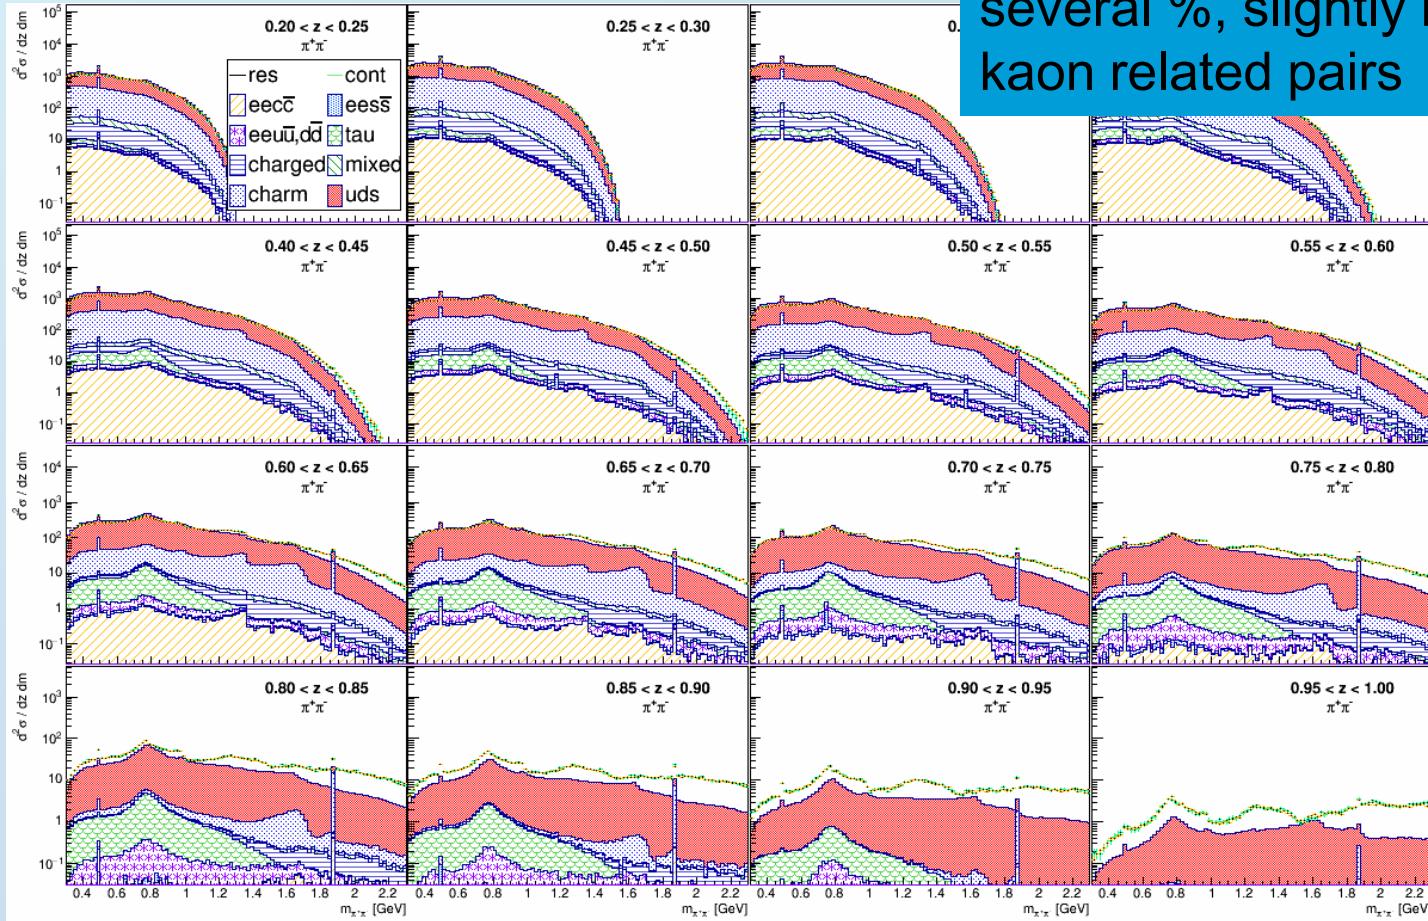

# Smearing

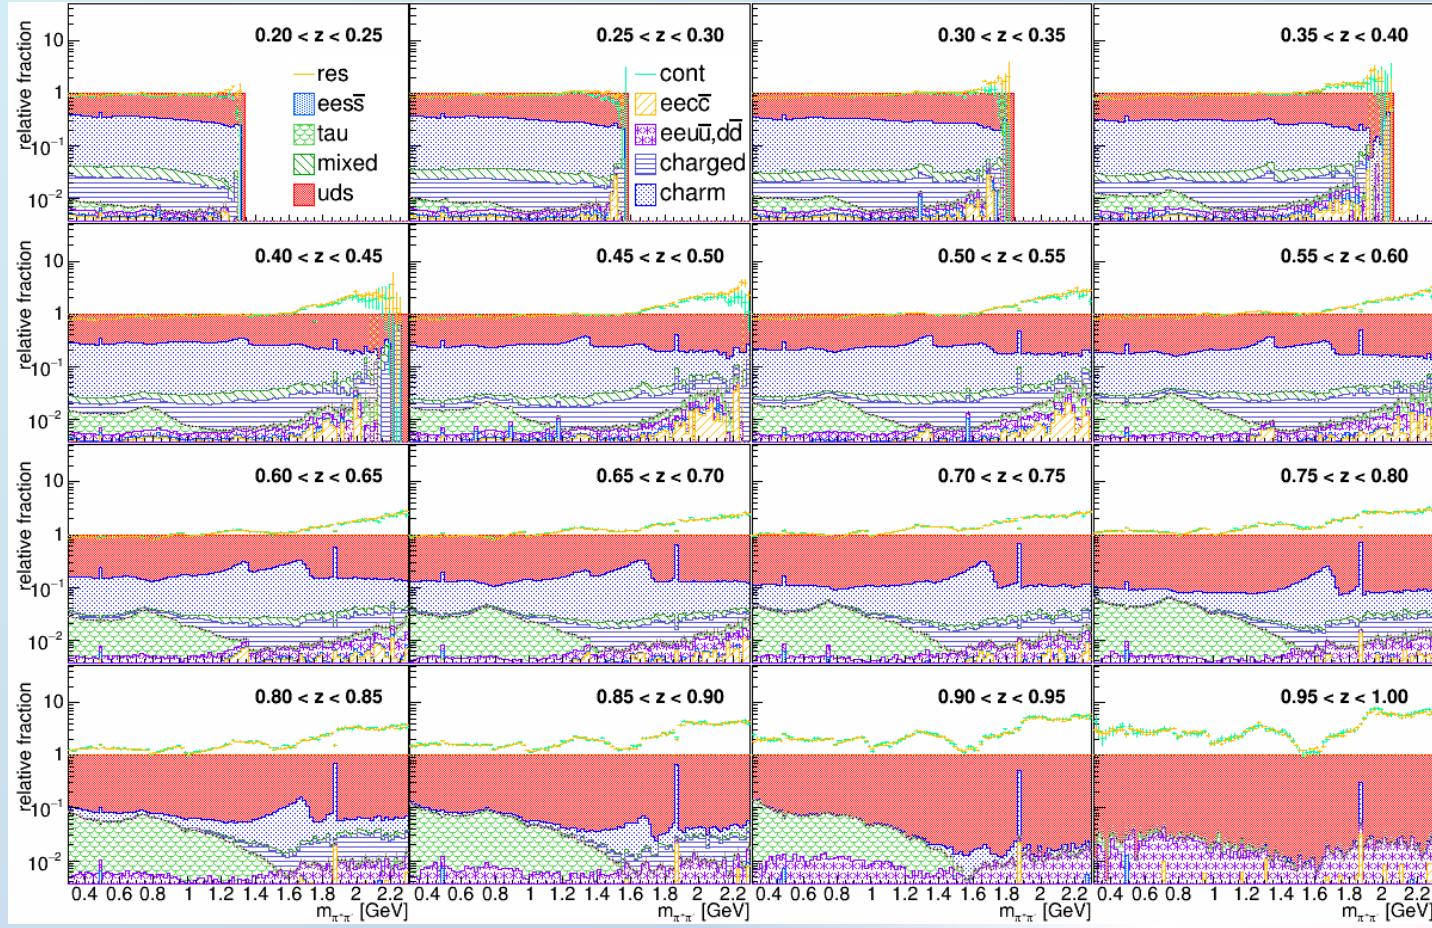

- Reduced smearing matrices from  $1600 \times 1600$  to filled (ie kinematically reachable bins)
- Using SVDUnfold Method in Root, generally good statistics and little regularization necessary

# Non-qqbar removal:

Remove all two-photon and tau events from yields, contributions generally up to several %, slightly higher for kaon related pairs

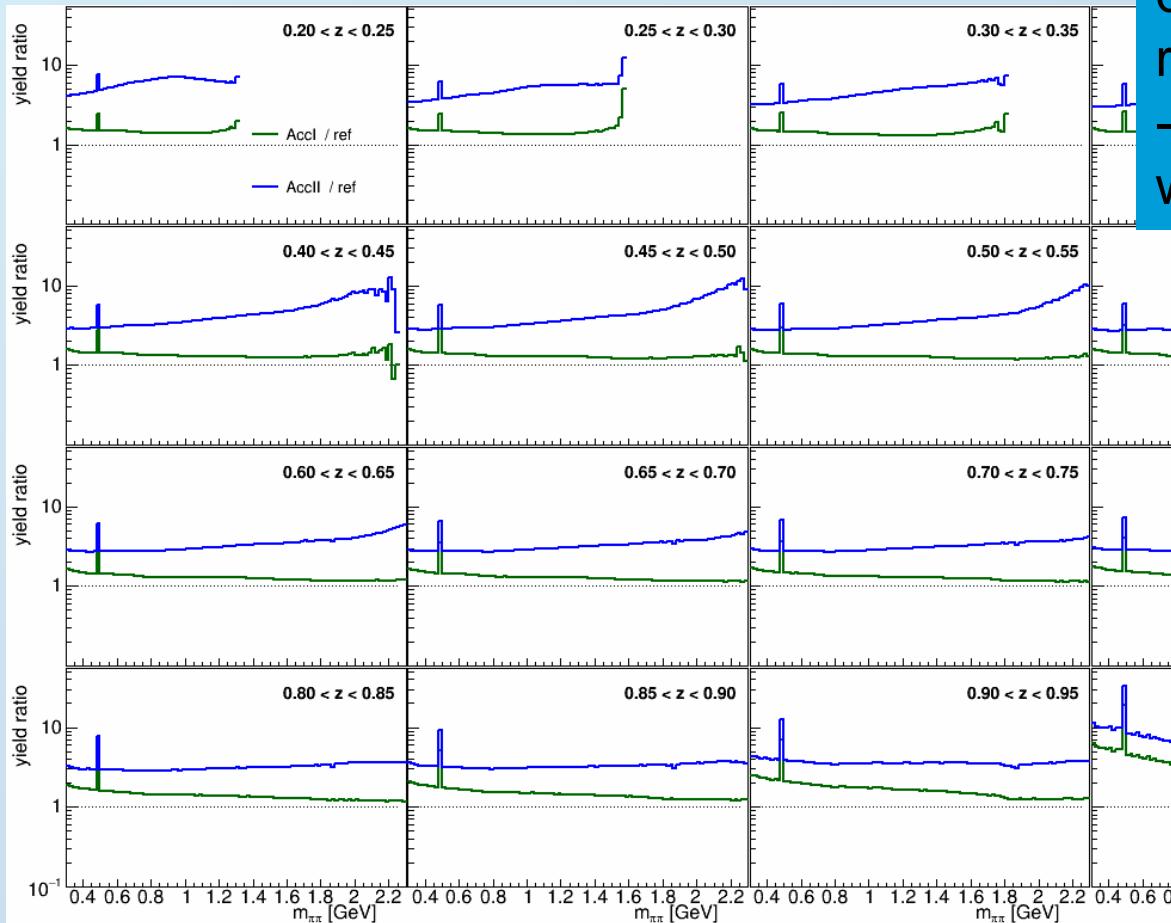

# Stacked, relative contributions

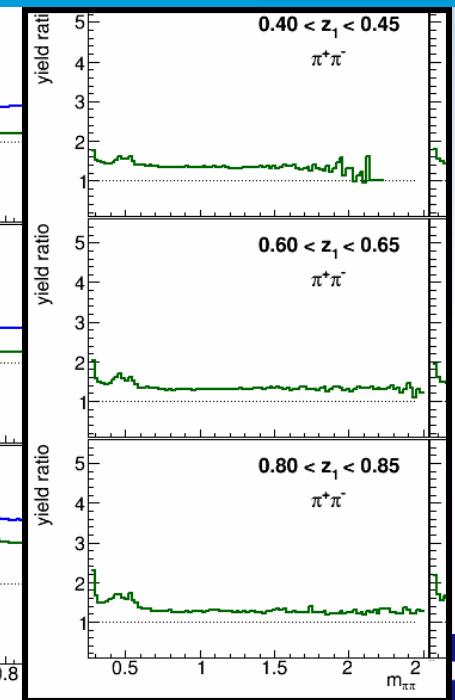

# Acceptance correction

ACCI: Reconstruction and efficiency correction in Barrel acceptance

ACCI: Barrel to  $4\pi$  correction

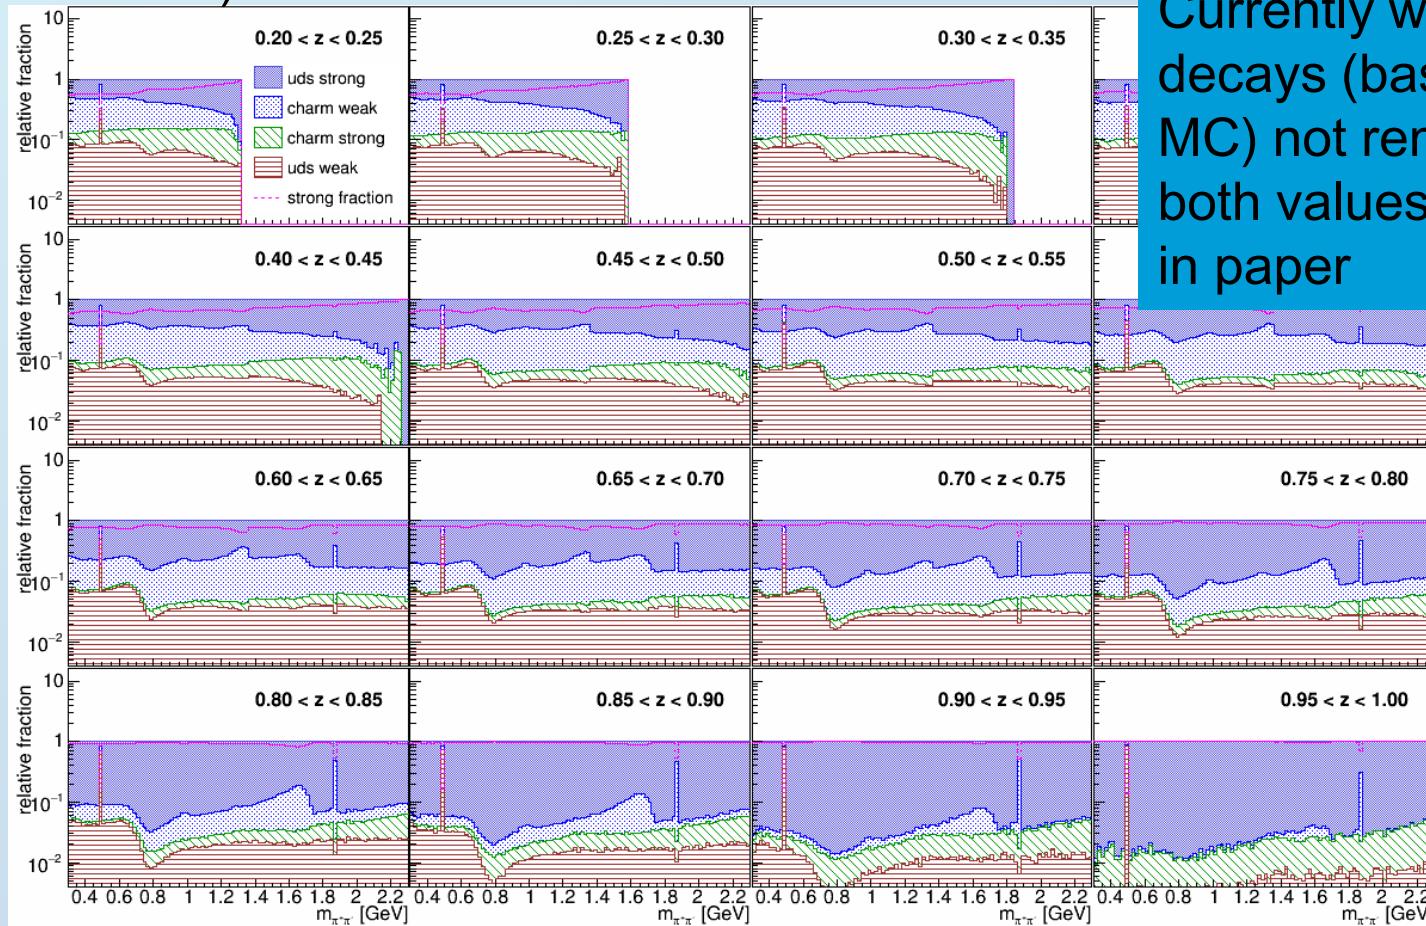

$K_S$  drop in efficiency due to SVD 3 hit requirement  
-increasing effect with  $z$  due to boost

# Weak correction(optional)

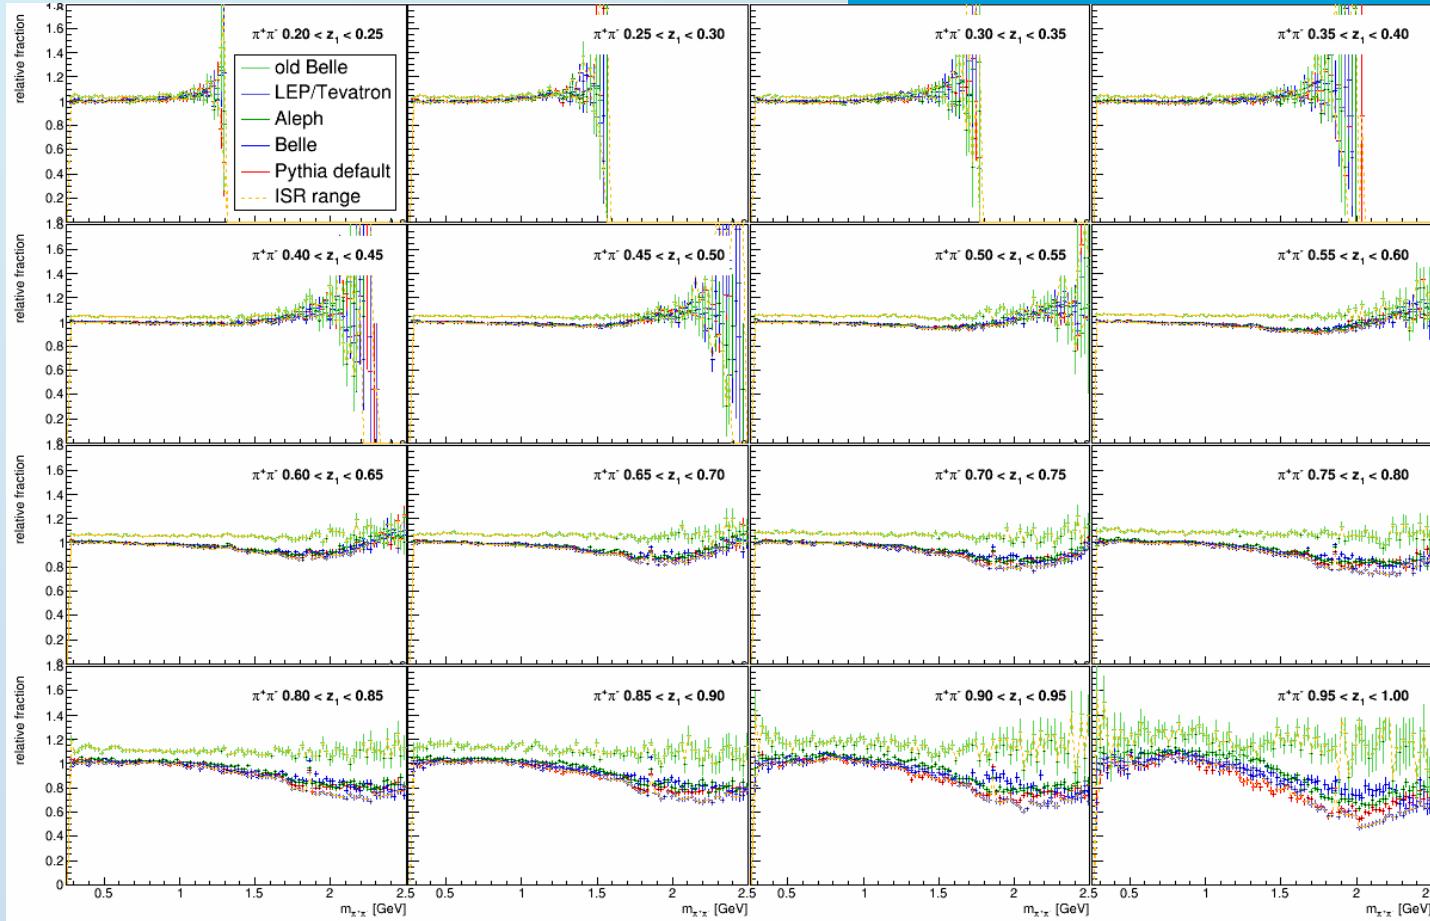

Traced in gen MC hadrons back to mothers with non ud content → if not vetoed (  $K^*$ , ssbar, ccbar resonances, some hyperons and excited states) → Weak

Currently weak decays (based on MC) not removed:  
both values provided in paper

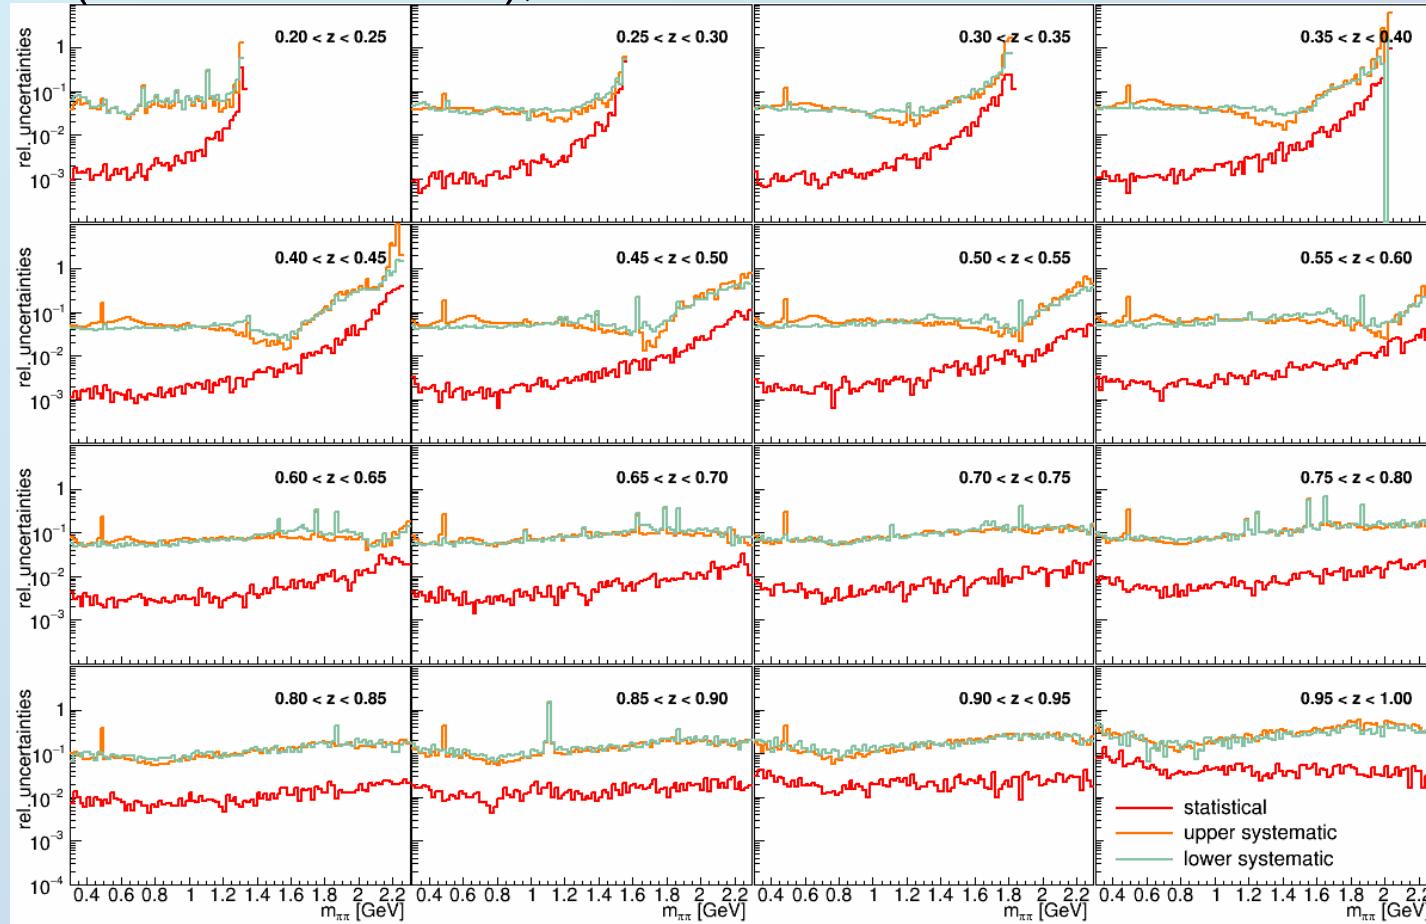

# ISR correction

All different tunes very similar  
except old Belle tune → assigned as systematics  
-high mass drop of ratio due to boost

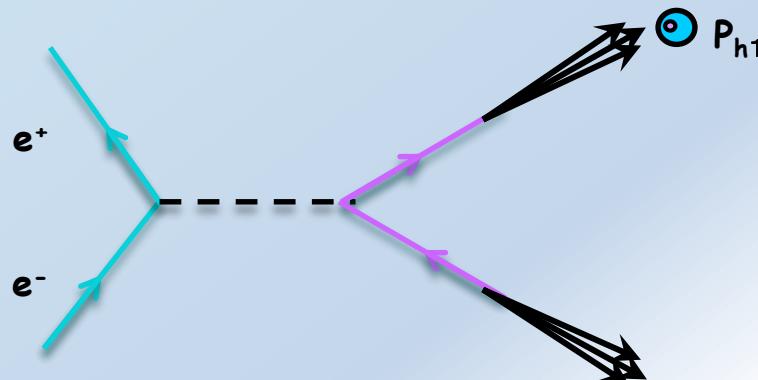

# Overall systematic uncertainties

Systematic uncertainties dominated by acceptance correction (for different tunes), PID uncertainties and ISR correction

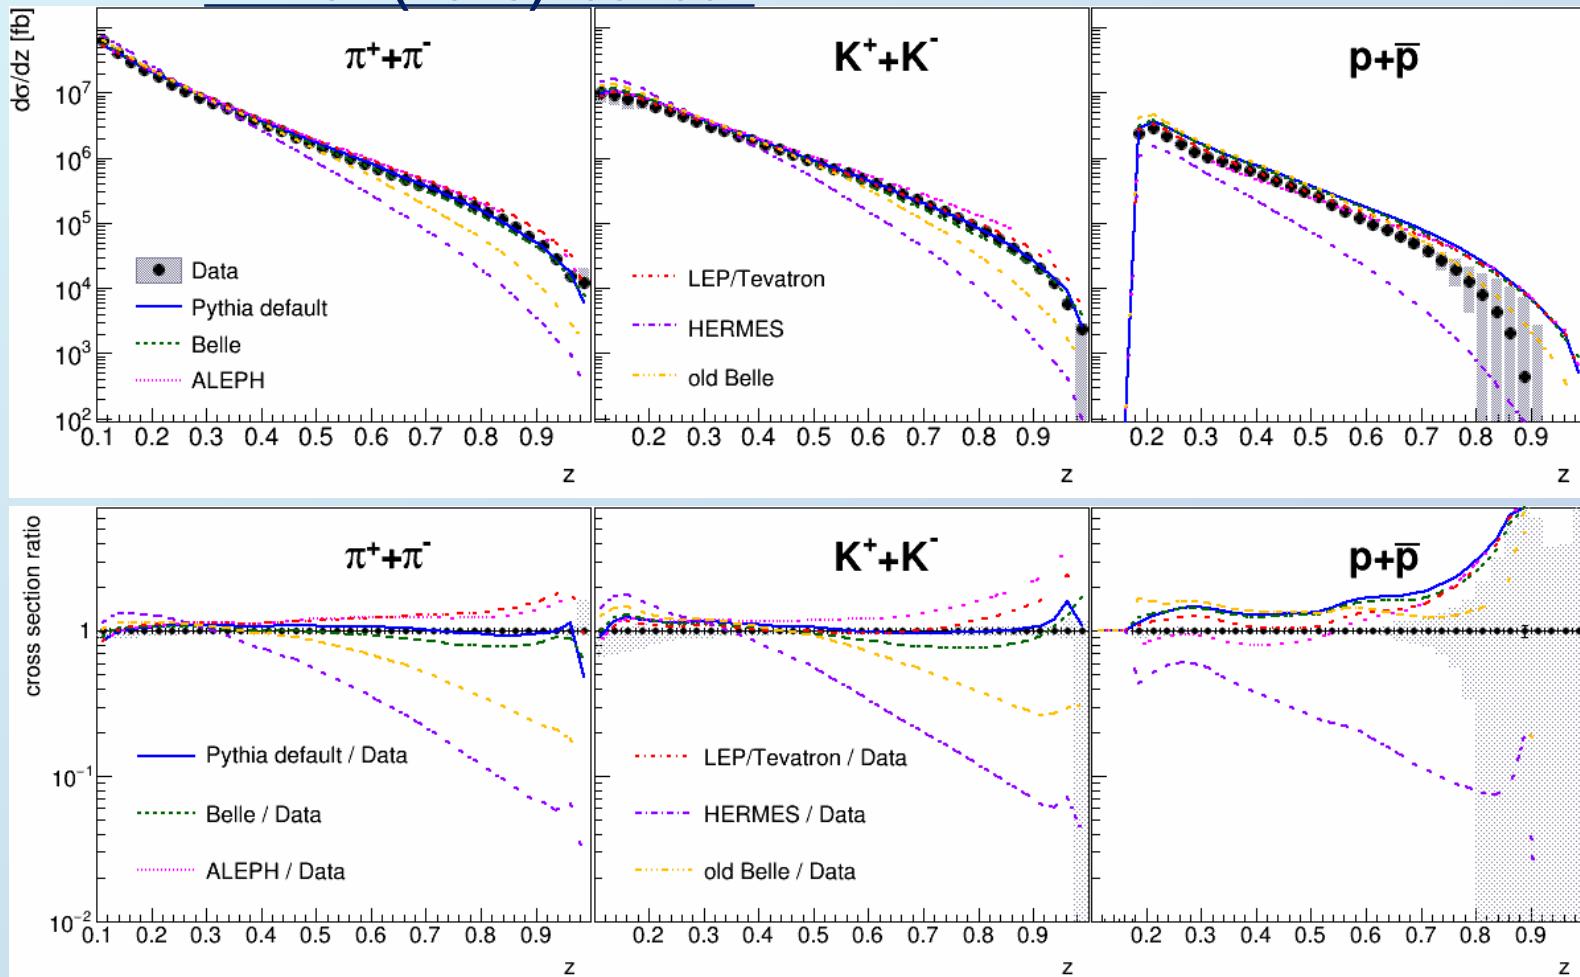

# Unpolarized fragmentation functions

$$D_{1,q}^h(z, Q^2)$$

# New addition: single protons

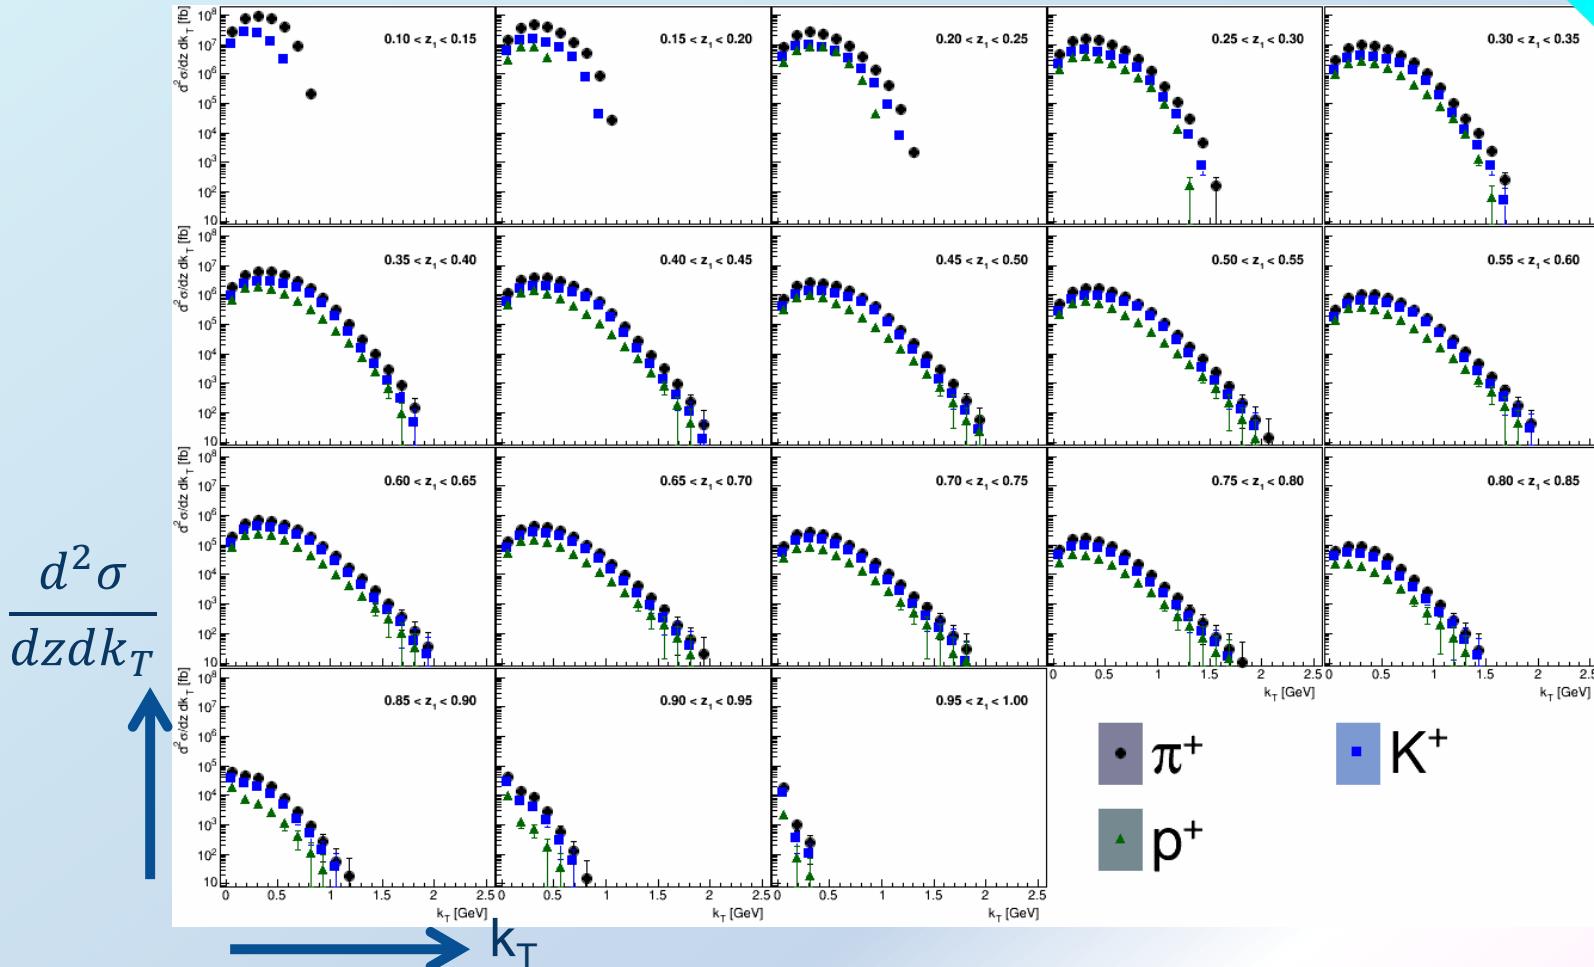

PRD92 (2015) 092007

- Default Pythia and current Belle in good agreement with pions and kaons
- Protons not well described by any tune

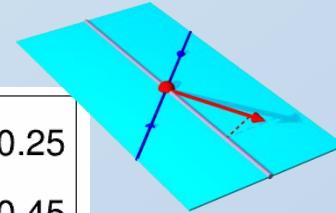

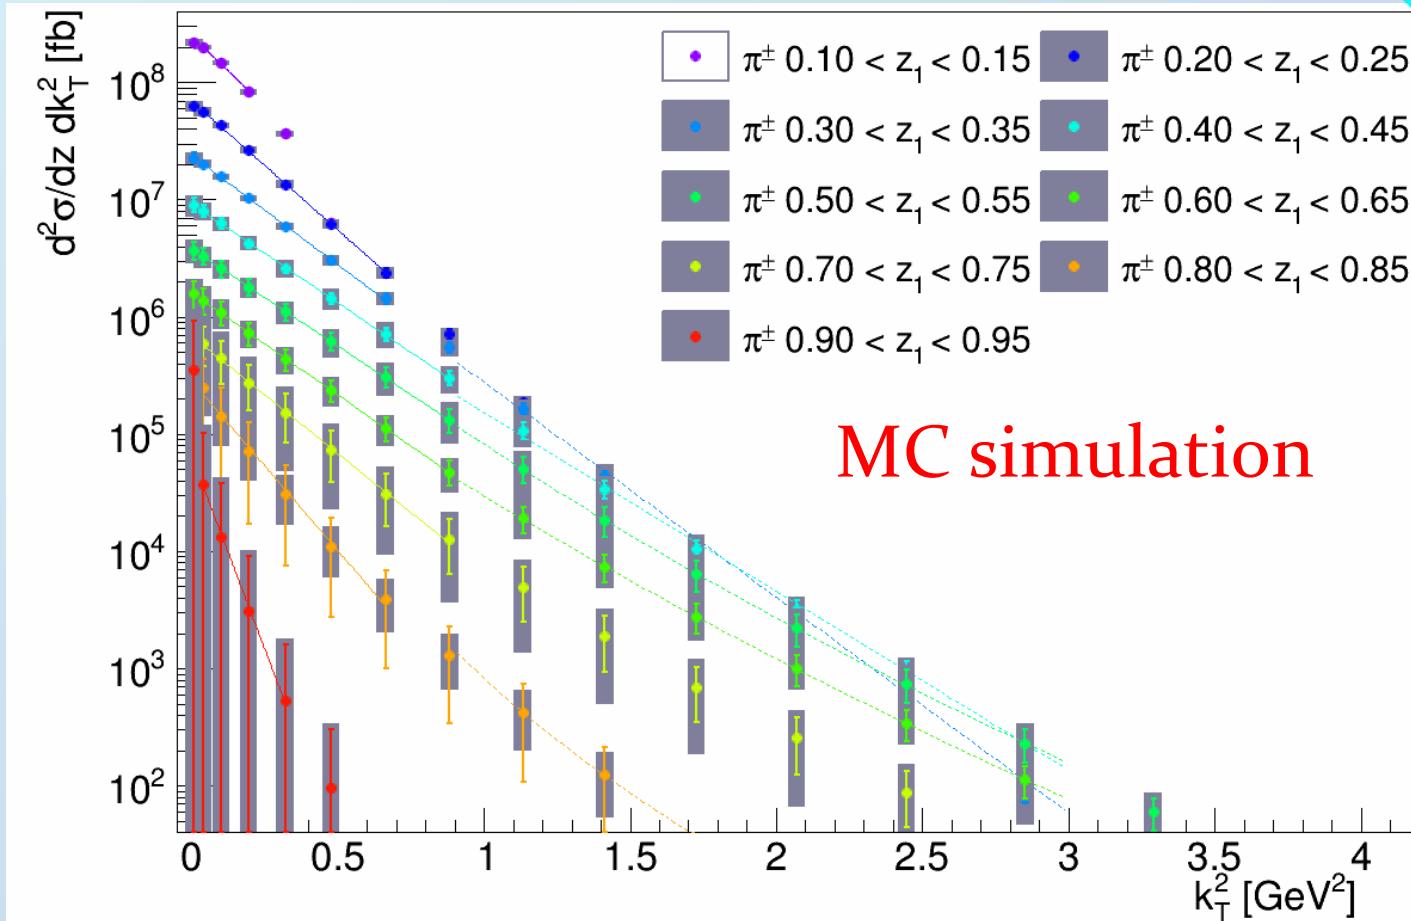

# MC sample for various hadrons

## MC simulation

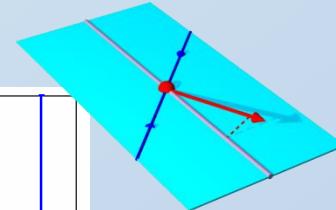

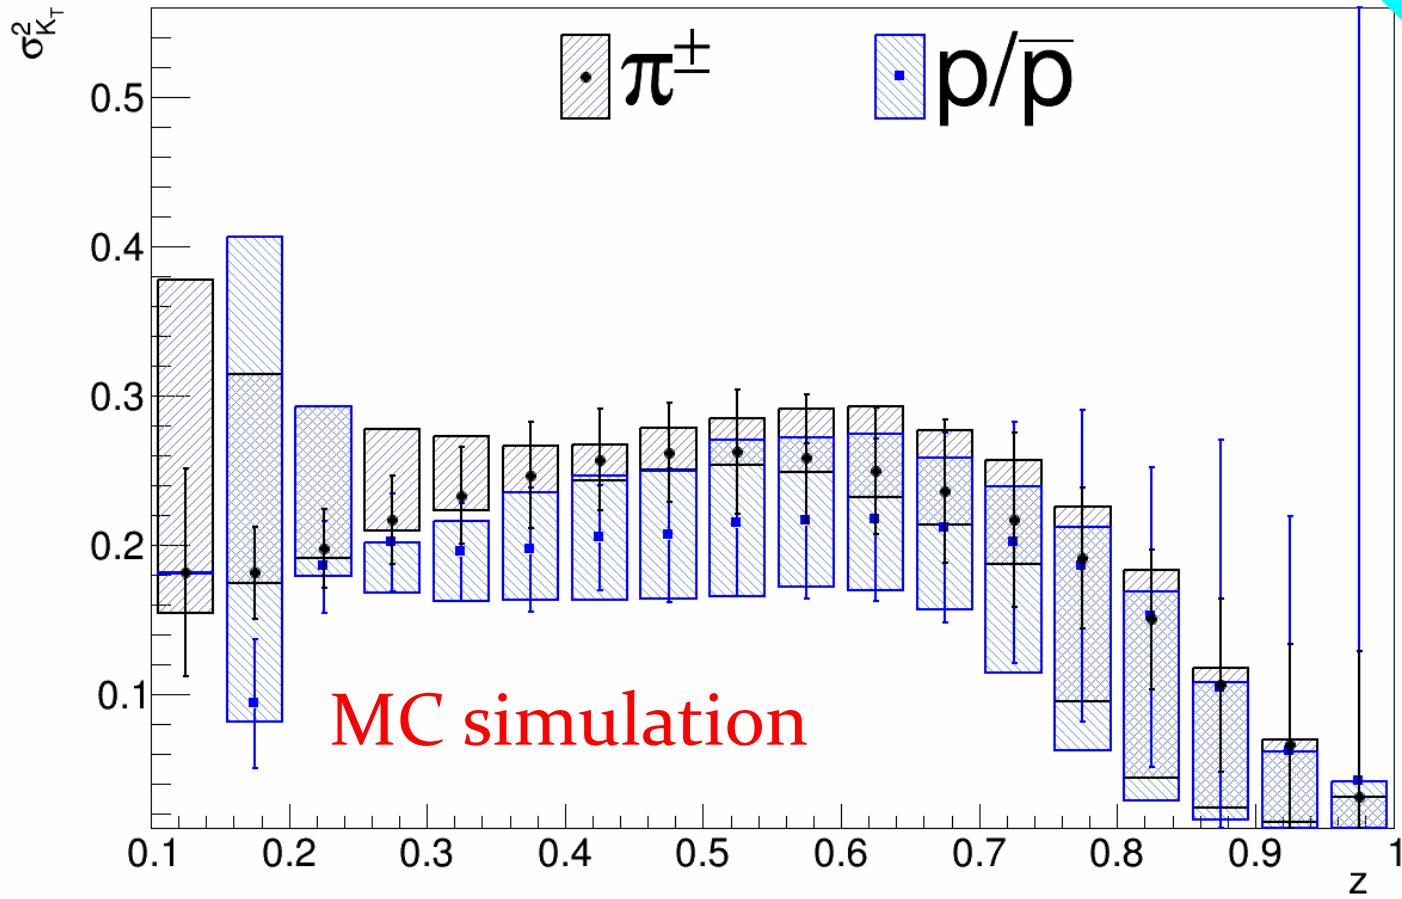

# MC examples vs $k_T^2$

Fit exponential to smaller transverse momenta for Gaussian  $k_T$  dependence and power low at higher  $k_T$

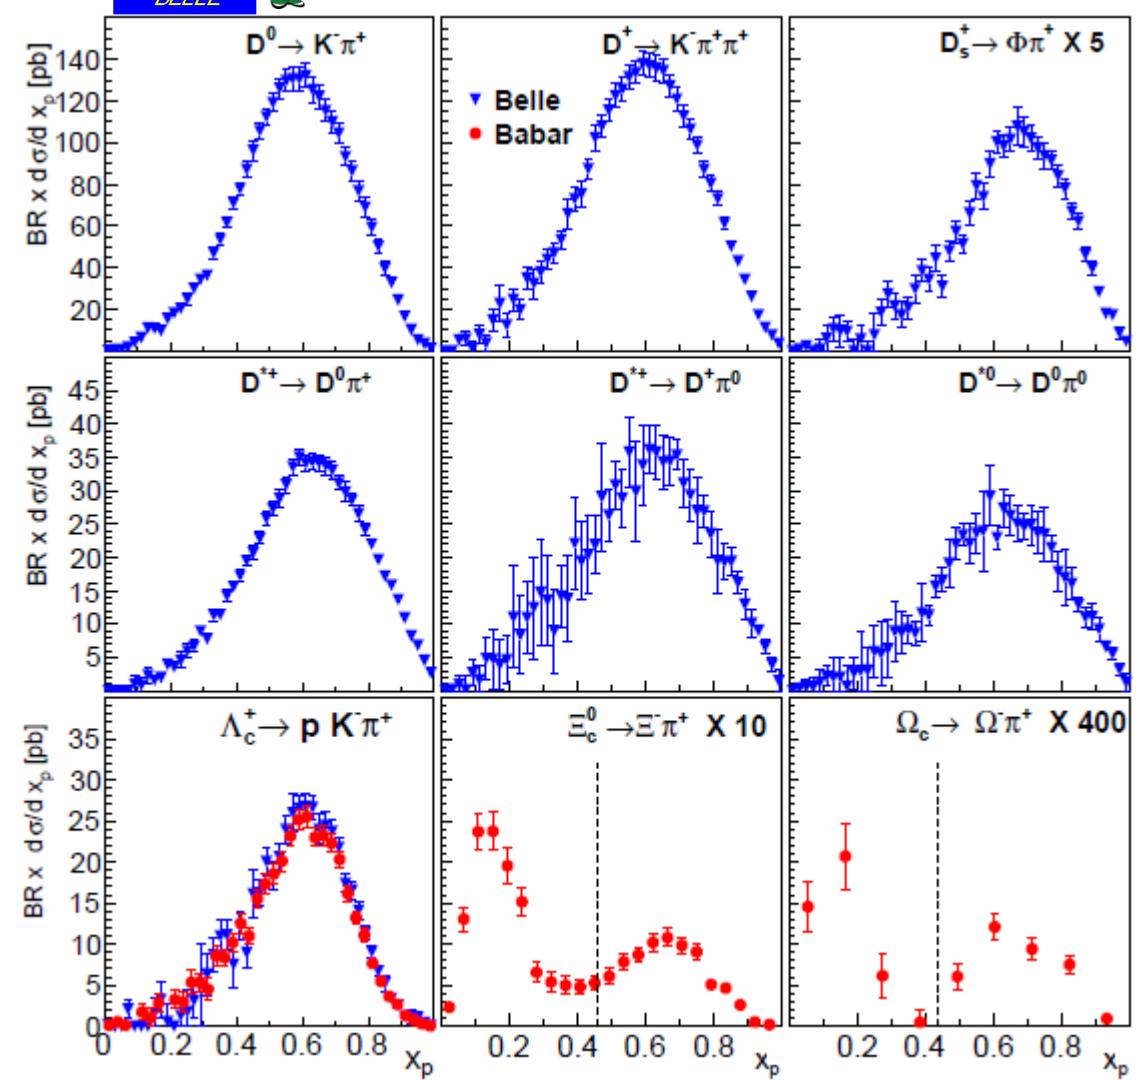

# MC Gaussian widths

Once available for data this will be the first direct (no convolutions) measurement of z dependence of Gaussian widths

# Charmed Fragmentation

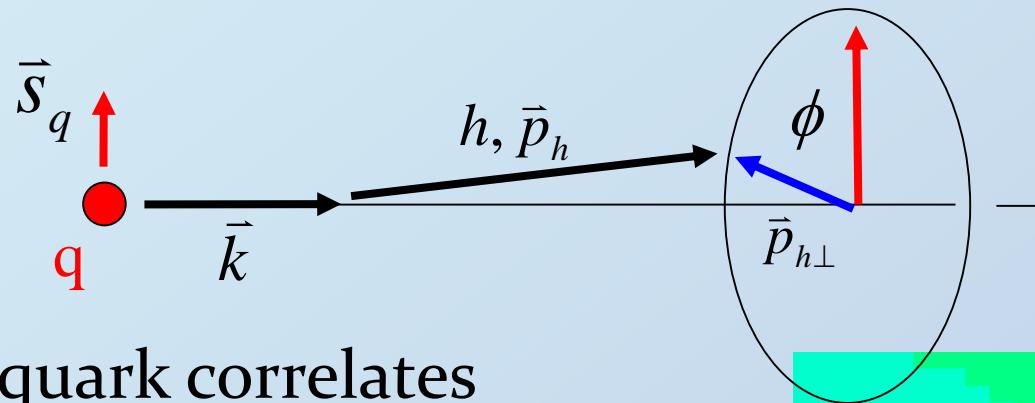

PRL.95, 142003 (2005)(Babar)  
 PRD73, 032002 (2006) (Belle)  
 PRD75, 012003 (2007)(Babar)  
 PRL 99, 062001 (2007)(Babar)

- Heavier particles generally plotted vs normalized momentum  $x_p = \frac{P^h}{P_{max}^h}$
- Unlike light hadrons charmed hadrons contain large fraction of charm quark momentum

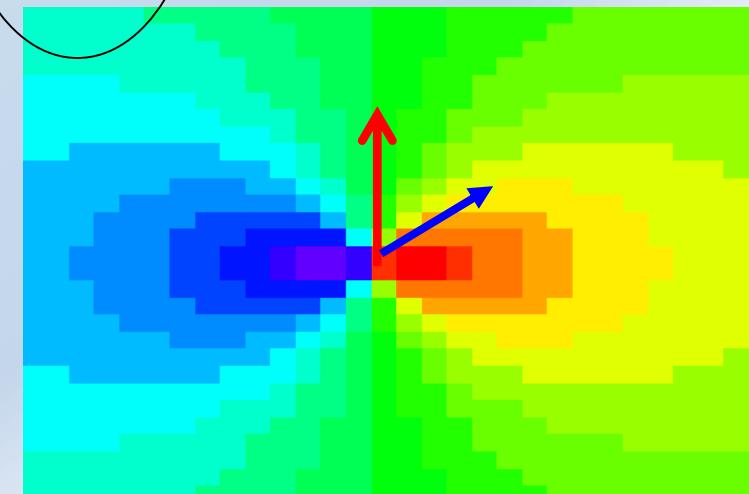

# Collins fragmentation function

J. Collins, Nucl. Phys. B396, (1993) 161

$$D_{q\uparrow}^h(z, P_{h\perp}) = D_{1,q}^h(z, P_{h\perp}^2) + H_{1,q}^{\perp h}(z, P_{h\perp}^2) \frac{(\hat{k} \times \mathbf{P}_{h\perp}) \cdot \mathbf{S}_q}{z M_h}$$

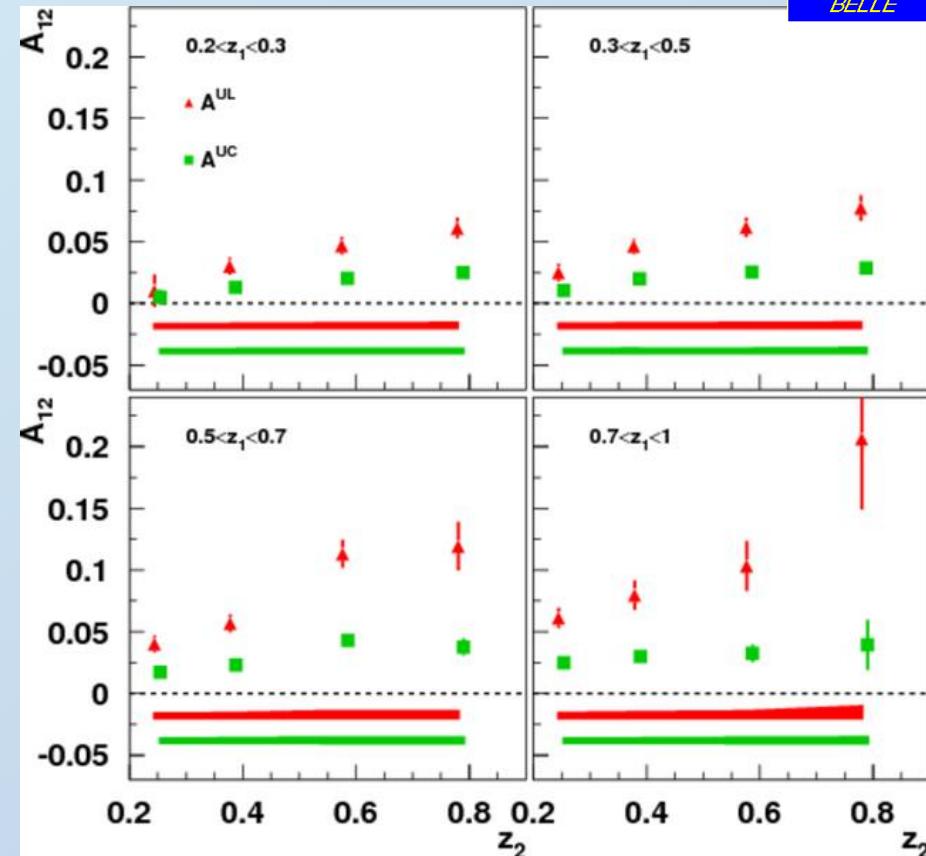

- Spin of quark correlates with hadron transverse momentum
- translates into azimuthal anisotropy of final state hadrons

# Belle Collins asymmetries

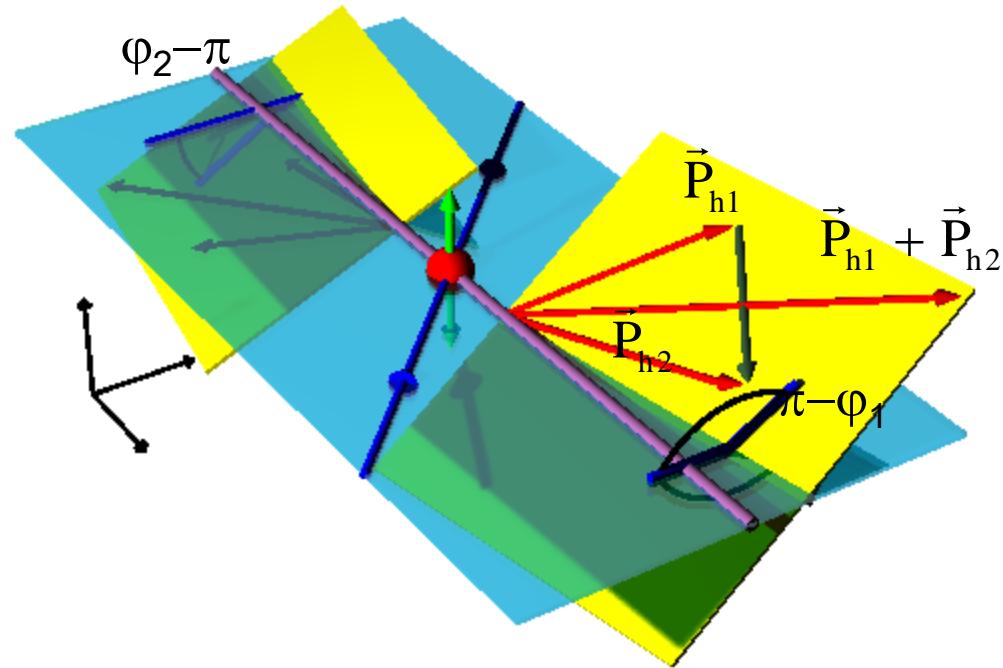

- Red points :  $\cos(\phi_1 + \phi_2)$  moment of **Unlike** sign pion pairs over **like** sign pion pair ratio :  $A^{UL}$
- Green points :  $\cos(\phi_1 + \phi_2)$  moment of **Unlike** sign pion pairs over **any charged** pion pair ratio :  $A^{UC}$
- Collins fragmentation is large effect
- Consistent with SIDIS indication of sign change between favored and disfavored Collins FF

RS et. Al. (Belle), PRL96: 232002  
 PRD 78:032011, Erratum D86:039905

# Interference Fragmentation (IFF) in $e^+e^-$

- $e^+e^- \rightarrow (\pi^+\pi^-)_{jet1}(\pi^+\pi^-)_{jet2}X$
- Theoretical guidance by papers of Boer,Jakob,Radici[PRD 67,(2003)] and Artru,Collins[ZPhysC69(1996)]
- Early work by Collins, Heppelmann, Ladinsky [NPB420(1994)]

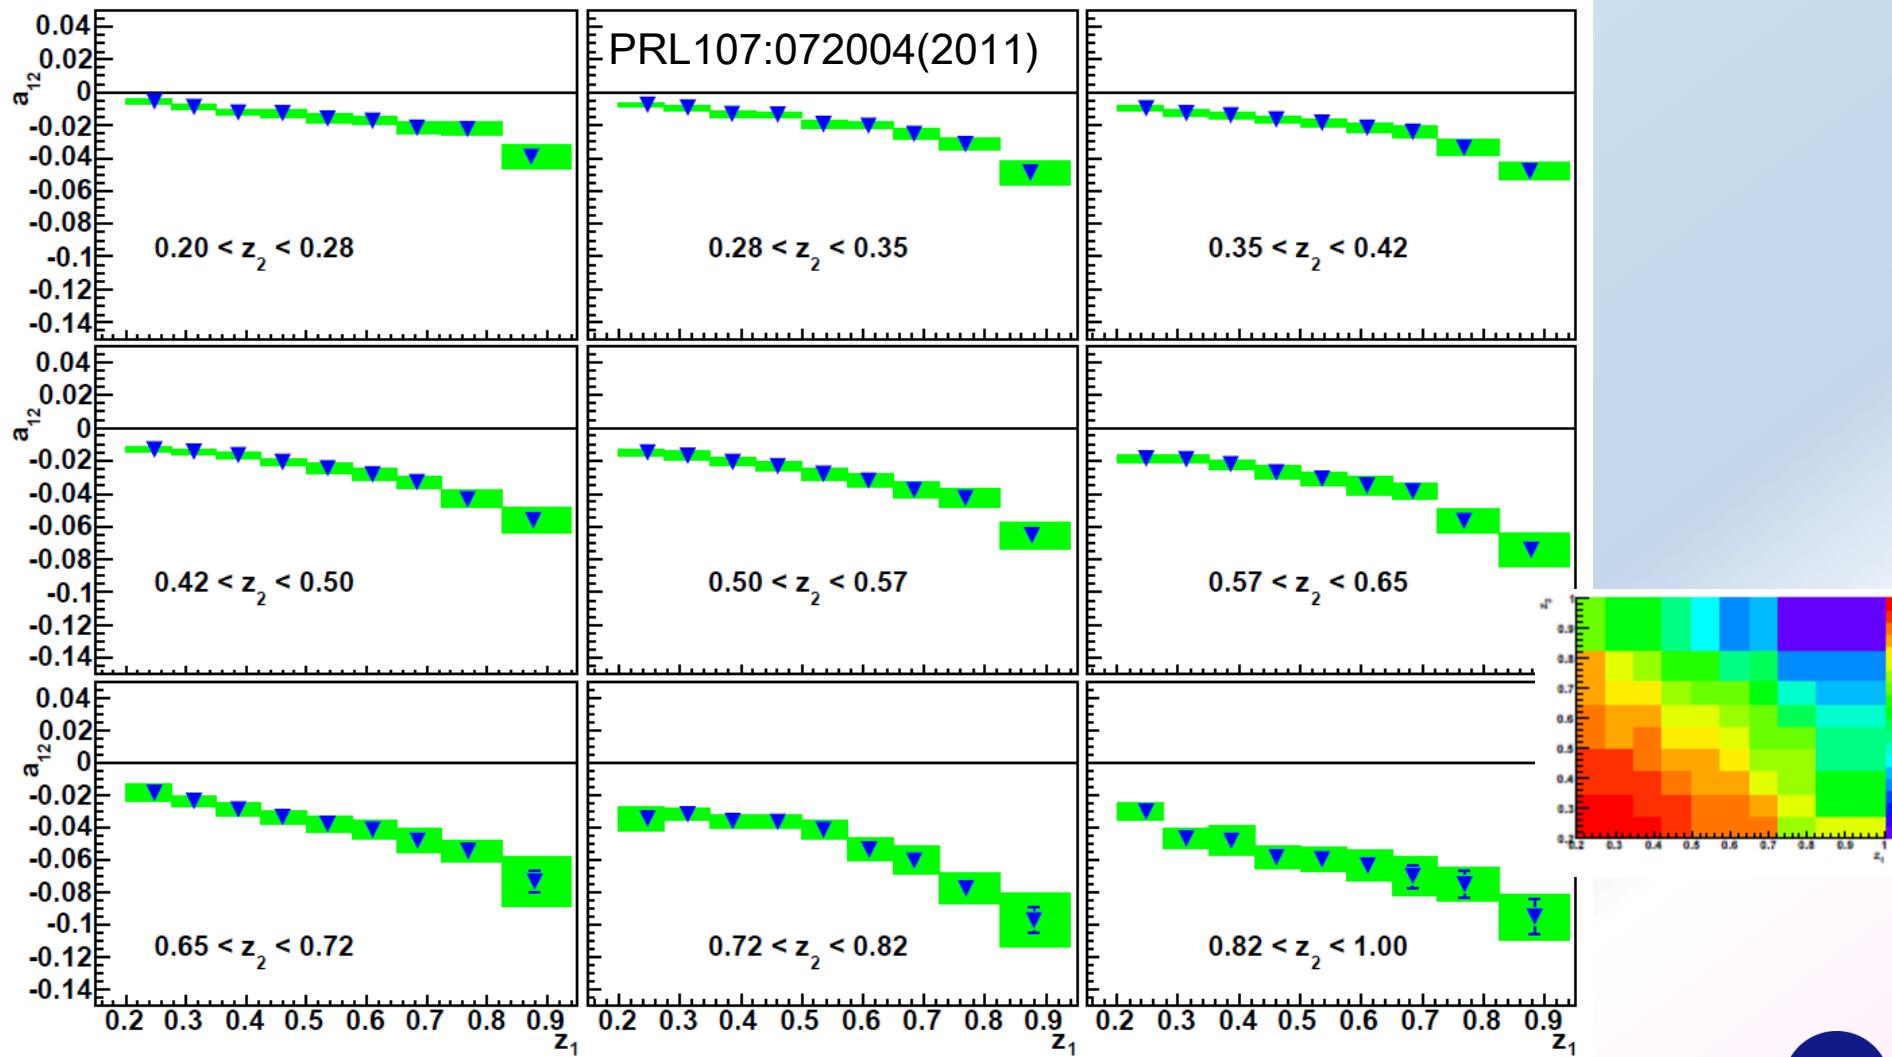

Model predictions by:

- Jaffe et al. [PRL 80,(1998)]
- Radici et al. [PRD 65,(2002)]

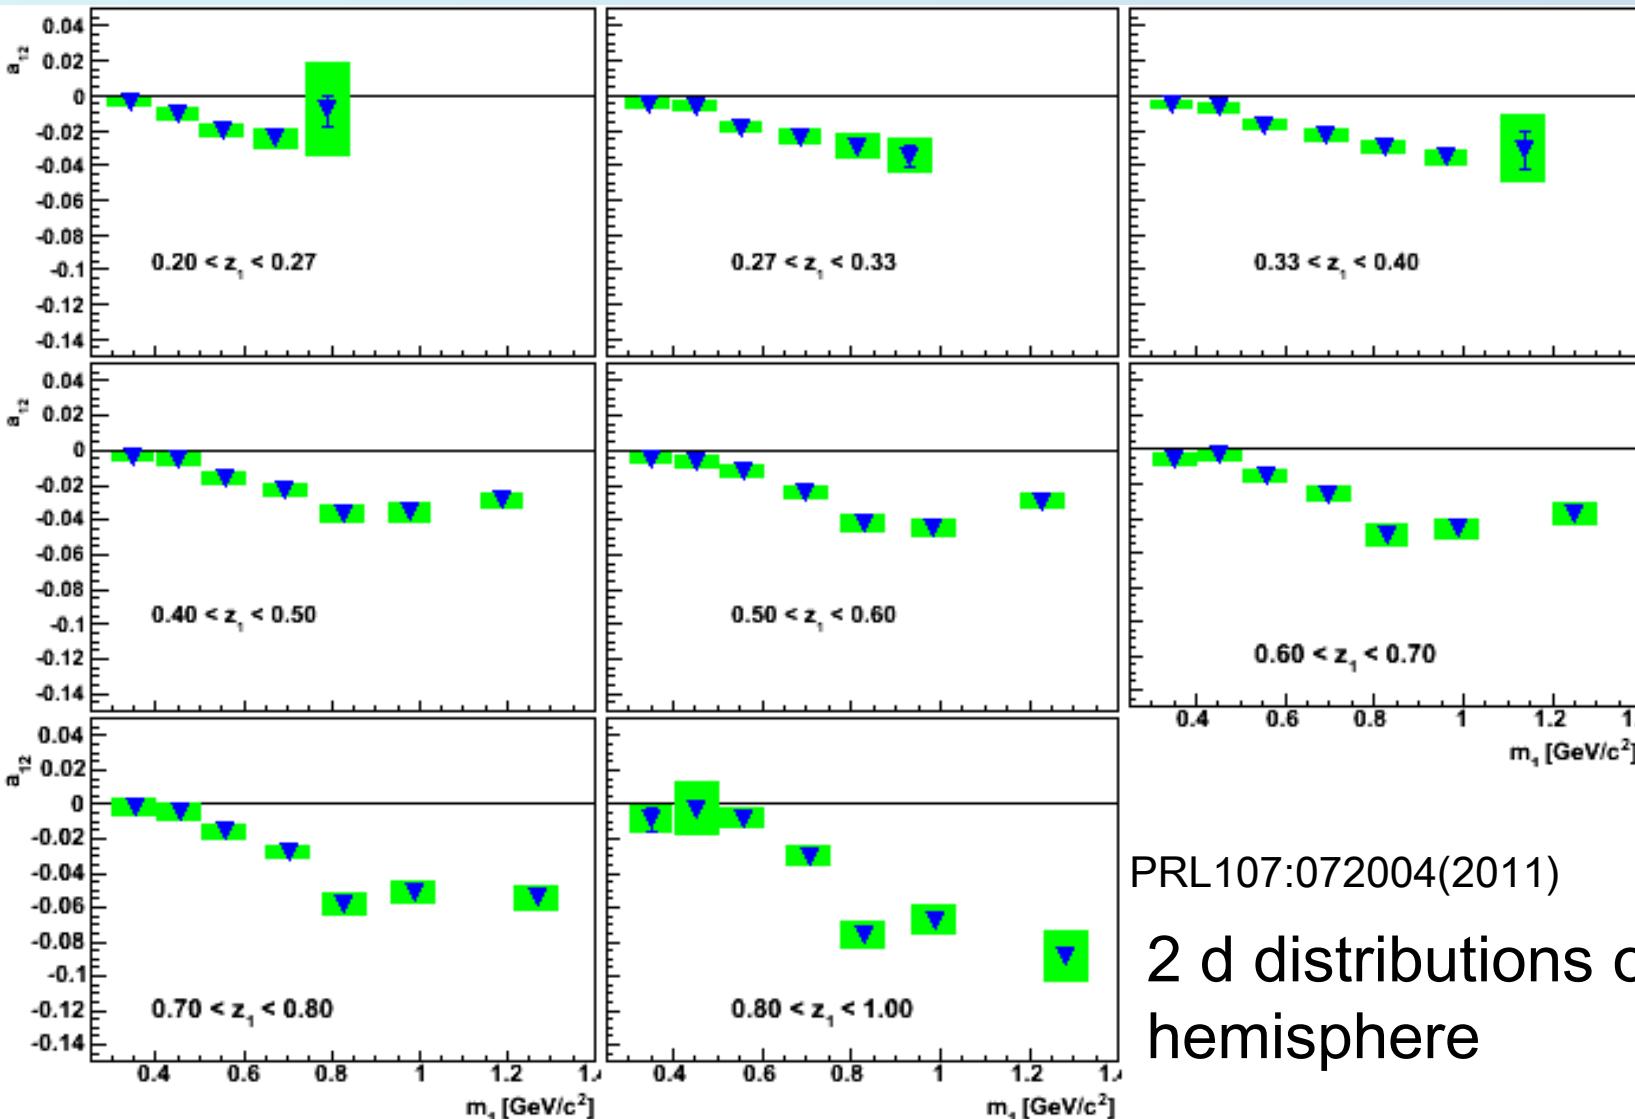

$$A \propto H_1^\angle(z_1, m_1) \bar{H}_1^\angle(z_2, m_2) \cos(\phi_1 + \phi_2)$$

# Belle IFF asymmetries: $(z_1 \times z_2)$ Binning

Magnitude increasing with  $z$

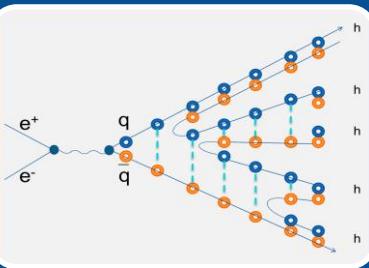

# Belle IFF asymmetries: $(z_1 \times m_1)$ Binning

PRL107:072004(2011)

2 d distributions of one hemisphere

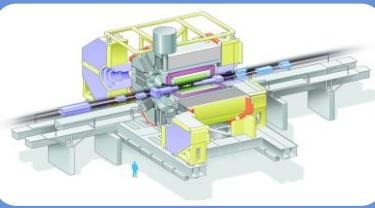

# What are fragmentation functions?

How do quasi-free partons fragment into confined hadrons ?

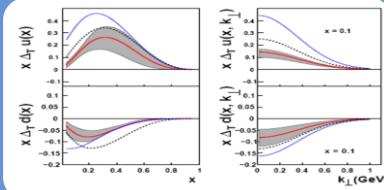

- Does spin play a role ? Flavor dependence?
- What about transverse momentum (and its Evolution) ?

What experiments measure :

- Normalized hadron momentum in CMS :  $e^+e^- \rightarrow h(z) X$  ;  $z = zE_h / \sqrt{s}$
- Hadron pairs' azimuthal distributions :  $e^+e^- \rightarrow h_1 h_2 X$  ;  
 $\langle \cos(\phi_1 + \phi_2) \rangle$  ; Collins FF、 Interference (IFF)
- Cross sections or multiplicities differential in  $z$ :  $ep \rightarrow hX$ ,  $pp \rightarrow hX$

Additional benefits of the FF measurements :

- Pol FFs necessary input to transverse spin SIDIS und pp measurements to extract Transversity distributions function
- Flavor separation of all Parton distribution functions (PDFs) via FFs (including unpolarized PDFs)
- Baseline for **any Heavy Ion measurement**
- Access to exotics?

# Fragmentation functions and spin structure of the nucleon

- Unpolarized fragmentation functions:
  - Provide flavor information in nucleon
  - Most apparent in SIDIS measurements related to  $\Delta q(x)$
  - But also required for all RHIC hadron asymmetries (especially pion  $A_{LL}$  charge ordering)
  - Transverse momentum dependence needed for Sivers and other TMDs
- Polarized fragmentation functions:
  - For transverse spin almost unique access (require two chiral-odd functions):
    - DY:  $\delta q \times \delta q$  or
    - SIDIS/RHIC:  $\delta q \times$  Collins or  $\delta q \times$  IFF
  - FFs from Belle/Babar
