## Anisotropic flow of multi-strange particles in Pb–Pb collisions at $\sqrt{s_{NN}} = 5.02$ TeV with ALICE

*Tuesday, 15 May 2018 19:10 (30 minutes)*

Anisotropic flow plays a critical role in understanding the properties of the quark-gluon plasma. In this poster we present the elliptic and triangular flow of multi-strange particles in Pb–Pb collisions at  $\sqrt{s_{NN}} = 5.02$  TeV. The measurements are presented at mid-rapidity for a wide range of particle transverse momenta. The results are compared to those for elliptic and triangular flow for other identified hadrons and measurements for Pb–Pb collisions at lower energy.
