# J/psi coherent photo-production at very low transverse momentum in Pb-Pb collisions at sqrt{s\_{NN}} = 5.02 TeV with ALICE

Tuesday 15 May 2018 19:10 (30 minutes)

A large excess in the yield of  $J/\psi$  at very low transverse momentum ( $p_T < 300~{\rm MeV}/c$ ) and forward rapidity (2.5< y <4.0) was recently reported by ALICE using the LHC Run-1 data, in Pb-Pb collisions at  $\sqrt{s_{\rm NN}}$  = 2.76 TeV. This is suggestive of coherent  $J/\psi$  photo-production, similar to measurements in ultra-peripheral collisions (UPC), where the nuclei only interact electromagnetically.

During the LHC Run-2, the measurement of the very low  $p_{\rm T}$  J/ $\psi$  at mid-rapidity (-0.9< y <0.9) in the dielectron decay channel was possible thanks to the large sample of recorded Pb-Pb collisions. The central barrel detectors provide a good momentum resolution, and make the measurement sensitive to the key characteristics of J/ $\psi$  coherent photo-production, like the corresponding transverse momentum spectrum.

In this poster, we will present the  $p_{\rm T}$ -integrated and  $p_{\rm T}$ -dependent coherent J/ $\psi$  photo-production cross-section at mid rapidity in Pb-Pb collisions at  $\sqrt{s_{\rm NN}}$  = 5.02 TeV. Our data will be discussed in comparison to the UPC measurements and model calculations. The expectations for this measurements with LHC Run-3 and Run-4 data will be discussed.
