Parity Doubling of Baryons in QCD Thermodynamics

Chihiro Sasaki

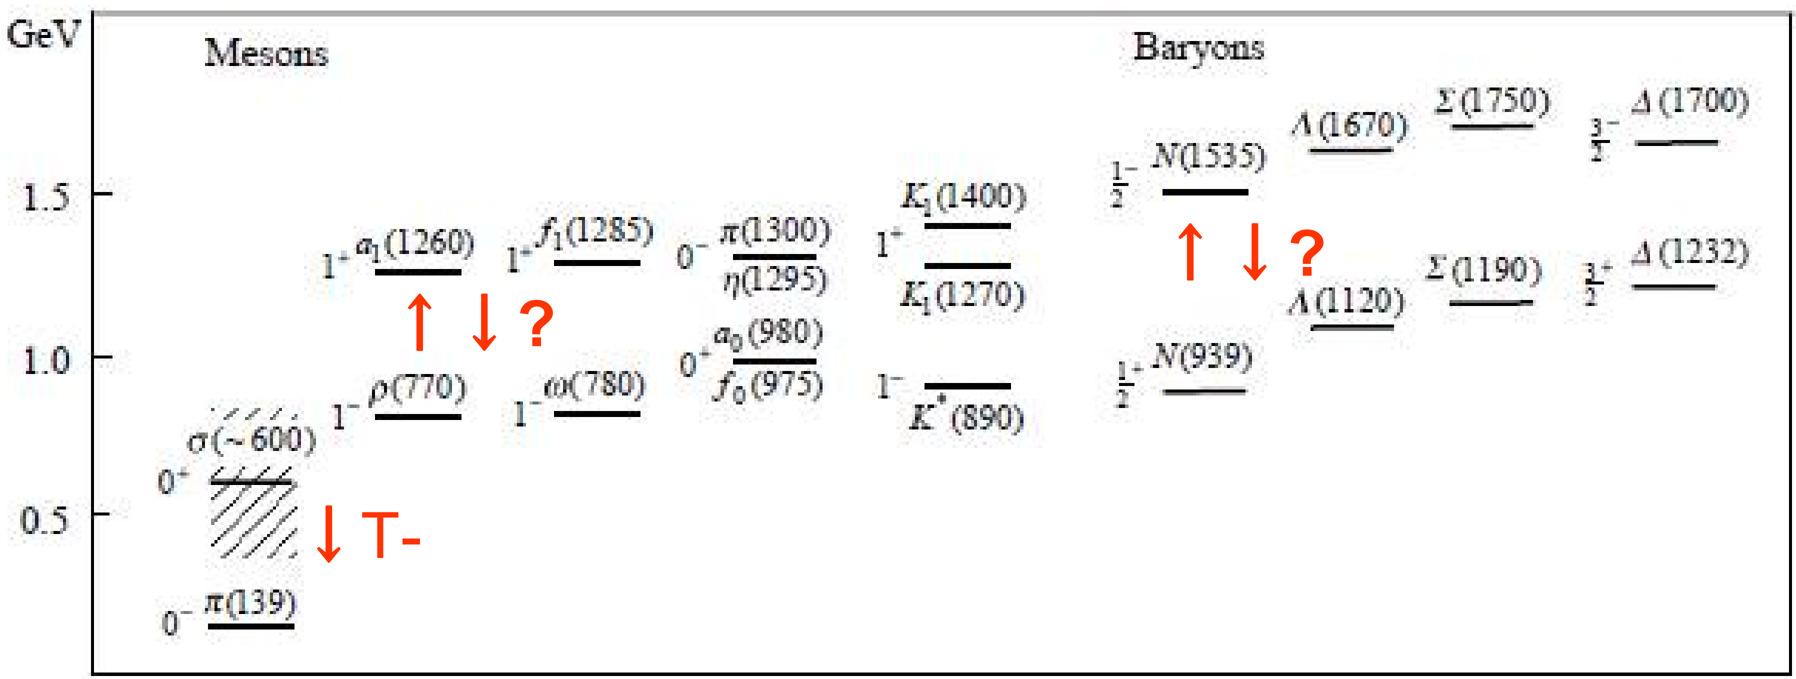
Institute of Theoretical Physics

University of Wroclaw

in collaboration with
Kenji Morita (RIKEN & Wroclaw),
Pok Man Lo, Krzysztof Redlich (Wroclaw)

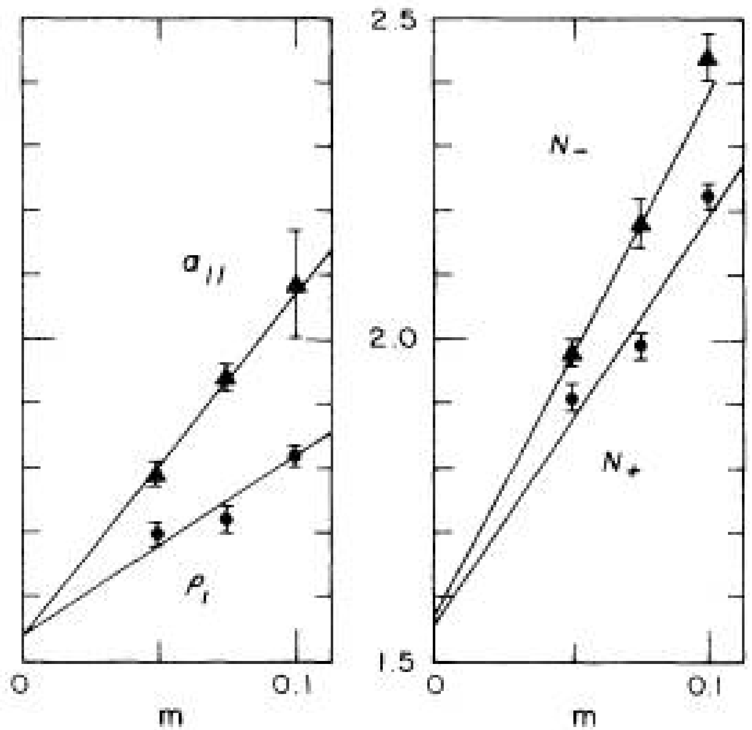
Spectra in a chirally restored world

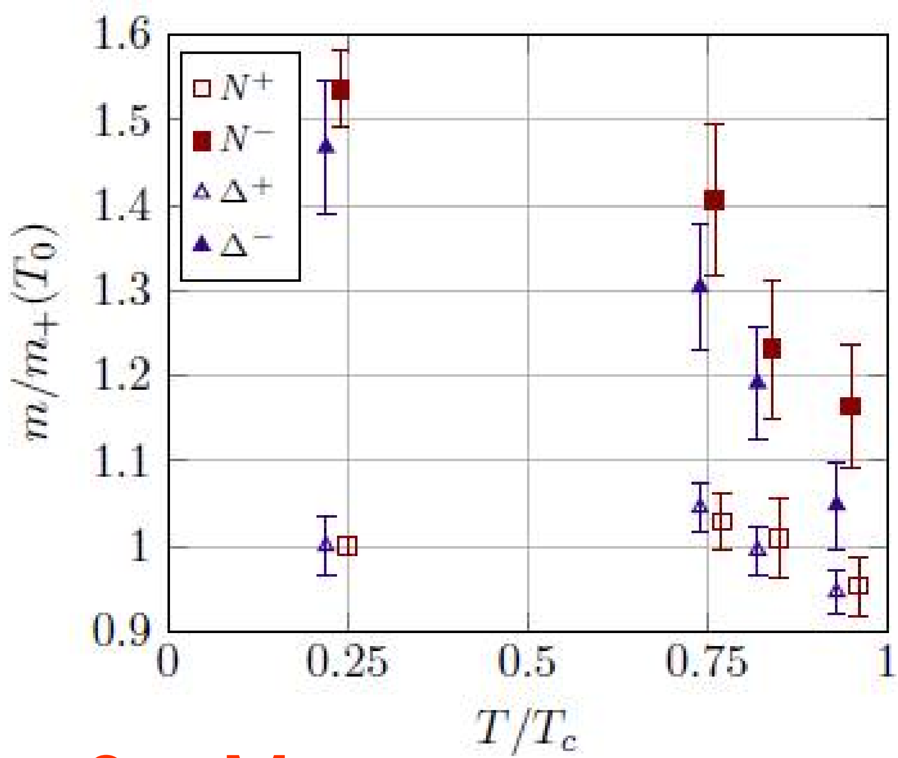
- ❑ Lowest scalar meson → O(4) vector with pion
- ❑ Parity partners degenerate → chiral partners
- ❑ QCD ground-state particles: pions & nucleons



Lattice QCD tells us …

- Spatial correlations [DeTar-Kogut, 1987]
- Temporal correlations [FASTSUM Coll., 2015-17: mpi≈400 MeV, mk≈500 MeV, Wilson fermions, Tch=185 MeV]





vs. Mn ≈ 3 x Mq

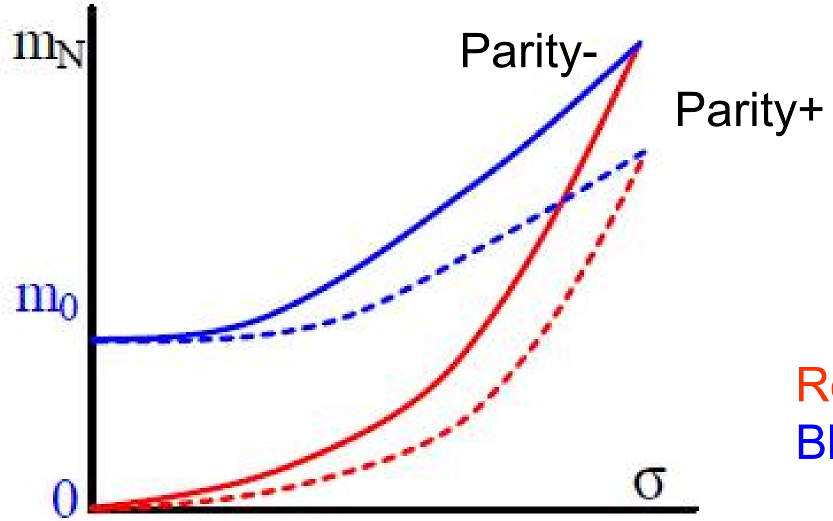
Non-SCB mass of nucleons

- SU(2) chiral transformation of 2 nucleons

  → how to assign 2 indep. rotation to them?

$$\psi_{1L} \to g_l\, \psi_{1L}\,, \quad \psi_{1R} \to g_r\, \psi_{1R} \;\sim\; \psi_{1L} : (1/2, 0) \quad \psi_{1R} : (0, 1/2)$$
$$\psi_{2L} \to g_r\, \psi_{2L}\,, \quad \psi_{2R} \to g_l\, \psi_{2R} \;\sim\; \psi_{2L} : (0, 1/2) \quad \psi_{2R} : (1/2, 0)$$

$$\mathcal{L}_m = m_0 \left(\bar{\psi}_2 \gamma_5 \psi_1 - \bar{\psi}_1 \gamma_5 \psi_2\right) \;\Rightarrow\; m_{N_\pm} = \frac{1}{2}\left[\sqrt{c_1 \sigma^2 + 4 m_0^2} \mp c_2 \sigma\right]$$



[DeTar-Kunihiro, 1989]

Red: Standard
Blue: Mirror

Origin of the survival mass?

❑ Emergence of a scale in QCD → trace anomaly

$$\partial_\mu J^\mu = T^\mu_\mu \propto \langle H | G^2 | H \rangle$$

- in hot matter: reduced by 50% at Tc [Miller, 2007: lattice EoS]
- in nuclear matter: reduced by 5% at normal ρ [Cohen et al. 1995: Feynman-Hellmann theorem & low-density approx.]

❑ How large is m0? --- not conclusive!

- Models: 300-800 MeV
- Lattice (FASTSUM): 800-900 MeV

✓ m0≈ a few Λqcd, mass diff.≈ weaker m0 dep.

Parity doubling of baryons

- Baryon octet and decuplet with finite m0
- Consistent with established phenomenology:
  - ✓ Gell-Mann-Okubo mass formula

$$\frac{3}{4}m_\Lambda + \frac{1}{4}m_\Sigma - \frac{1}{2}(m_N + m_\Xi) = 0$$

  - ✓ Gell-Mann's equal spacing rule

$$m_{\Sigma^*} - m_\Delta = m_{\Xi^*} - m_{\Sigma^*} = m_\Omega - m_{\Xi^*}$$

- Mass relations [CS, 2017]

$$M_B(\sigma_q, \sigma_s; a, b, m_0)$$

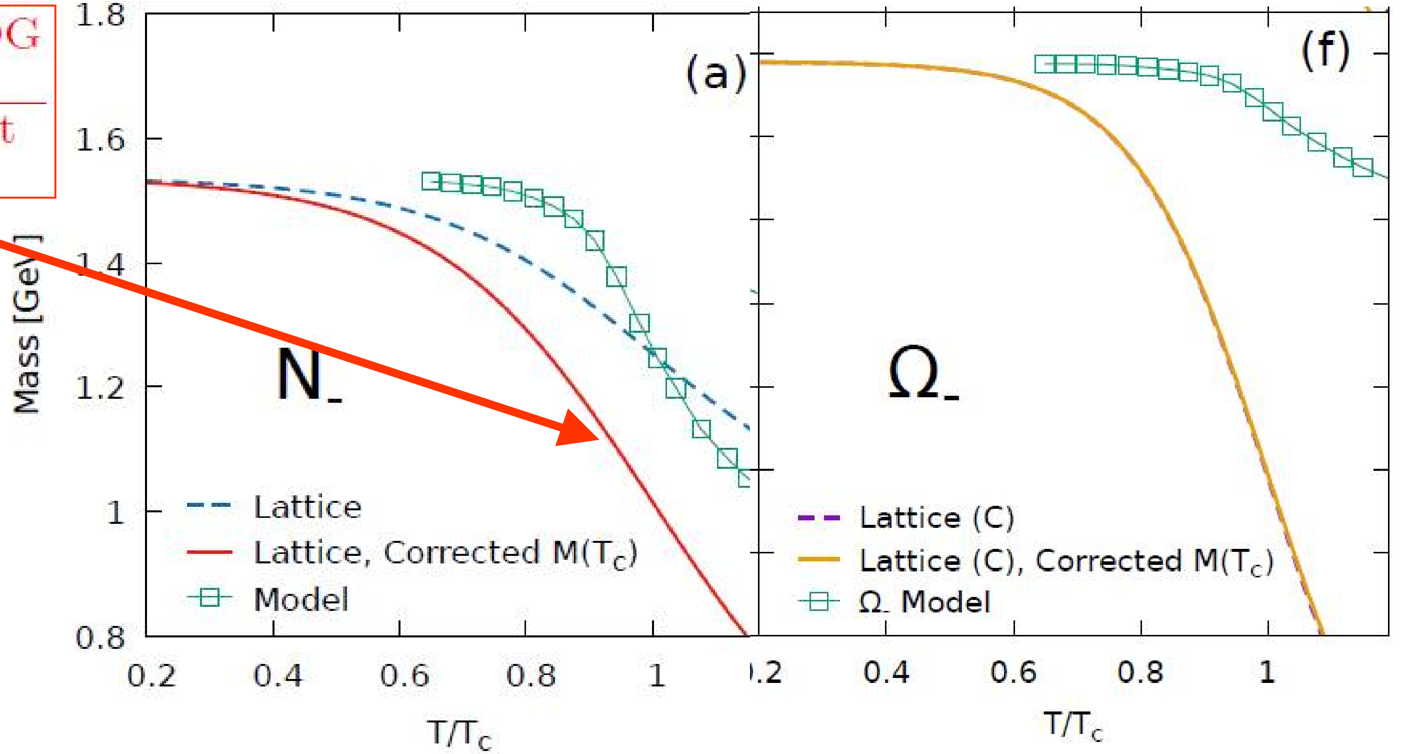
Light-quark condensate　Strange-quark condensate

Chiral model vs. LQCD (FASTSUM)

- Strong mpi dependence; SU(2+1) vs. SU(3)
- Fitting the LQCD masses [Aarts et al., 2017]

$$M^-(T) = M^-(T=0)\omega(T,b) + M^-(T_c)(1-\omega(T,b))$$
$$\omega(T,b) = \tanh[(1-T/T_c)/b]/\tanh(1/b)$$

$$M_-^{\rm lat}(T_c) \times \frac{M_+^{\rm PDG}}{M_+^{\rm lat}}$$



Any imprint in EoS?

Signal of chiral symmetry restoration

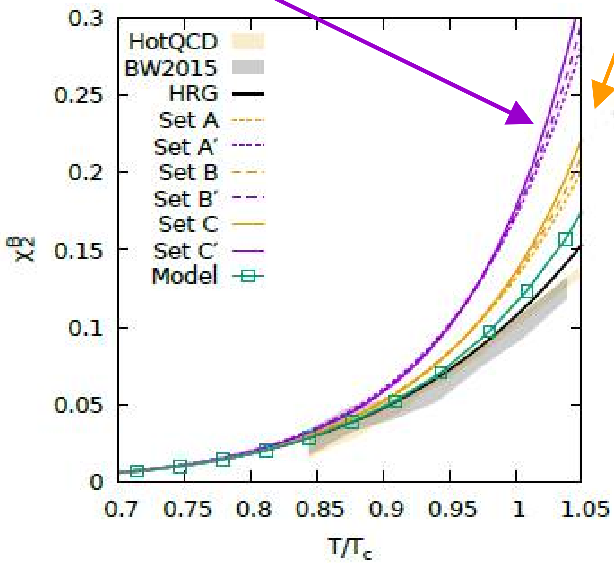
- Lattice QCD shows clearly <qqbar> dropping!
- More deviation from HRG in higher-order fluctuations → Missing states? Interactions? and/or in-medium effects?
- In-medium HRG [Aarts et al., 2017]
  - T-dep. masses motivated by Lattice findings
  - Constant masses for positive-parity states
  - Its verification? → baryon number fluctuations.

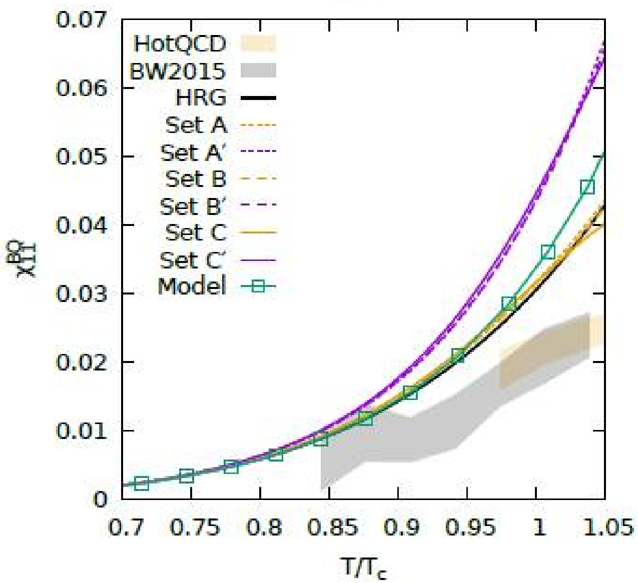
Fluctuations of net-baryon number

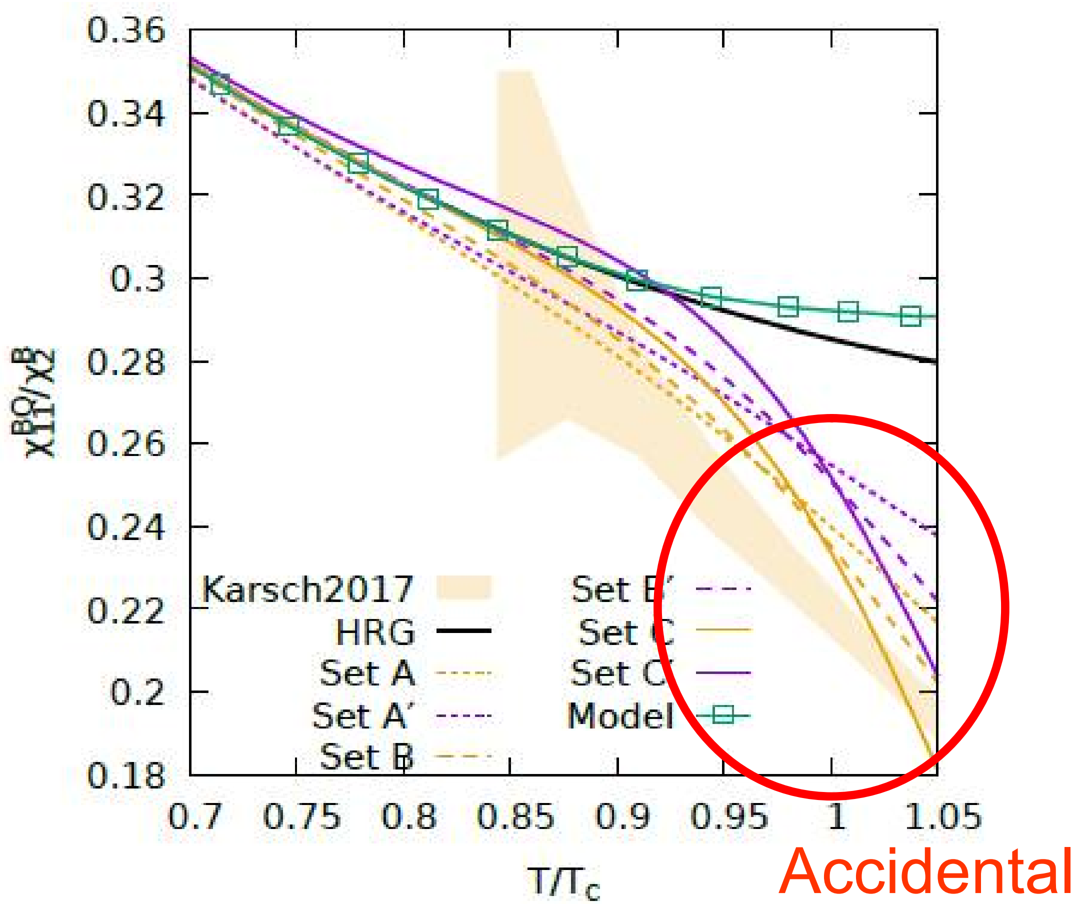
corrected $M_{-}^{\mathrm{lat}}(T_c)$

uncorrected

$$\chi_{ijk}^{BQS} \equiv \frac{\partial^{i+j+k}}{\partial^i(\mu_B/T)\partial^j(\mu_Q/T)\partial^k(\mu_S/T)} p(T,\mu_B,\mu_Q,\mu_S)/T^4$$







[Morita et al., arXiv:1711.10779 [hep-ph]]

What is missing? --- finite width

❑Thermodynamics of broad resonances

→S matrix approach [Dashen, Ma and Bernstein, 1969]

- Grand canonical potential

$$\Omega = \Omega_0 + \Omega_{\rm int}$$

$$\Delta \ln Z = \int dE\, e^{-\beta E} \frac{1}{4\pi i} \mathrm{tr} \left[S^{-1} \frac{\overleftrightarrow{\partial}}{\partial E} S \right]_c$$

- Leading contribution: 2-body [Beth-Uhlenbech, 1937]

$$\Delta \ln Z = \int dE\, e^{-\beta E} \times \frac{1}{\pi} \frac{\partial}{\partial E} \mathrm{tr}\,(\delta_E)$$

Phase shift

Dynamical information

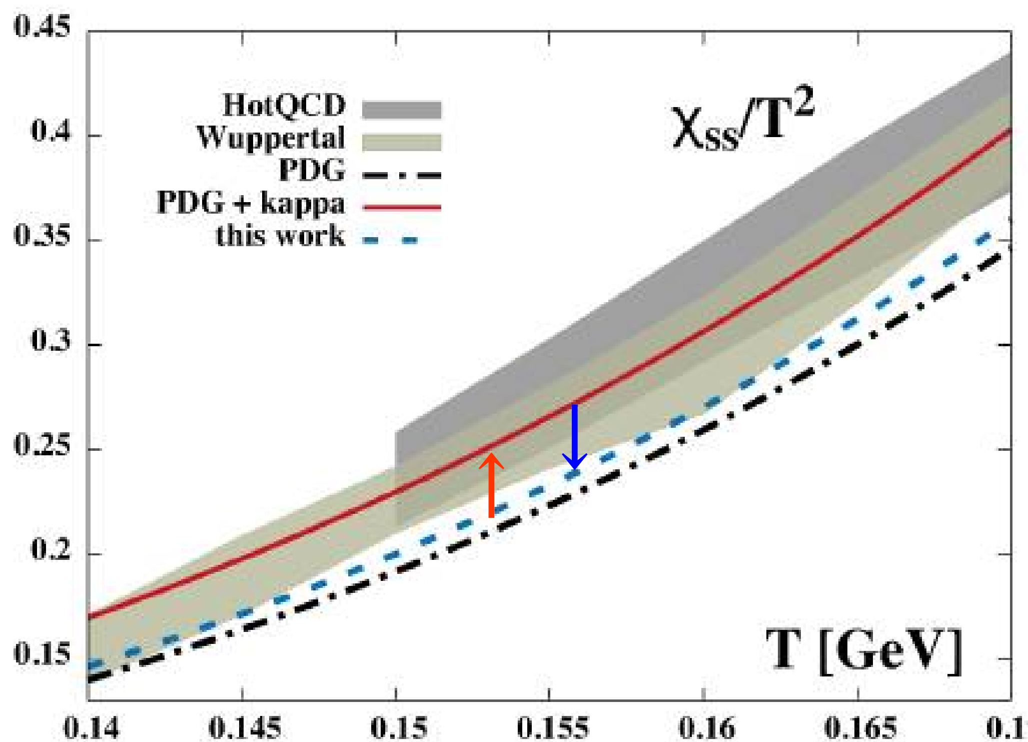
What is missing? --- finite width

- ❑K0*/ κ (800) meson: chiral partner of kaon
  - NOTE: omitted from PDG summary table
- ❑S matrix approach [Friman et al. 2015]
  - ✓Empirical π -K phase shift from experiment

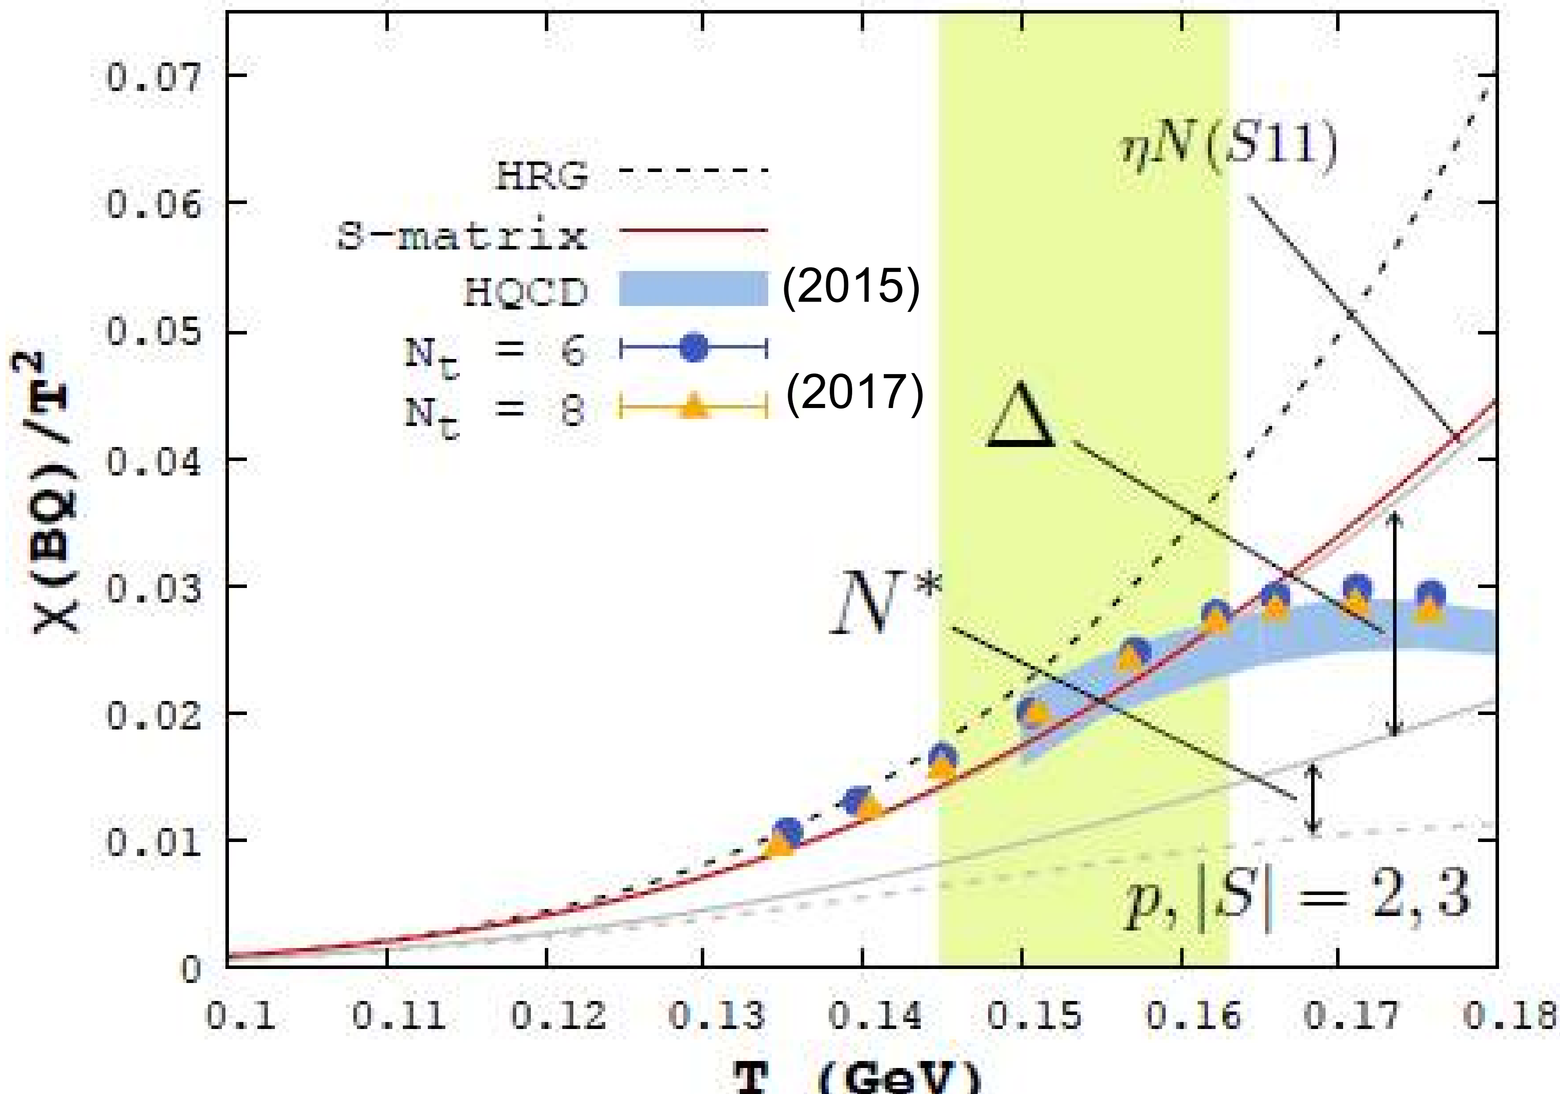
$$\Omega = \Omega_\pi + \Omega_K + \Omega_{\rm int}$$

cf. HRG

$$\Omega = \Omega_\pi + \Omega_K + \Omega_{\rm res}$$



Pi-Nucleon system [Lo et al., 2018]



Parity doublers in cold dense QCD

- ❑ Quark-nucleon hybrid model [Benic et al., 2015]
  - How to suppress quarks at low density?
    - ✓ IR/UV cutoff “b” in Fermi dist. functions
    - ✓ from const. “b” to a VEV of a scalar field b
  - Chiral & deconfinement p.t. in a single framework
- ❑ Symmetric matter [Marczenko, CS, 2017]
  - Net-baryon numb. fluct.: χ -dynamics dominated
- ❑ Asymmetric matter [Marczenko et al., to appear]
  - Constraints on the mass and compactness of a star → hadronic scenario w/o deconf.quarks

Summary

- ❑ Emergent parity-doubling structure as a manifestation of restored chiral symmetry

Lessons:

- ◆ Naive “in-medium HRG” does not work.
- ◆ Effect of resonance widths – beyond HRG
- ◆ Survival mass ≈ chromo-magnetic sector

- ◆ Higher-lying states near QCD p.t.
- ◆ Interplay between CSB and confinement
- ◆ Toward more realistic description of QCD
