Advanced modelling of cooling architectures for large scale infrastructures

Jakub Tkaczuk

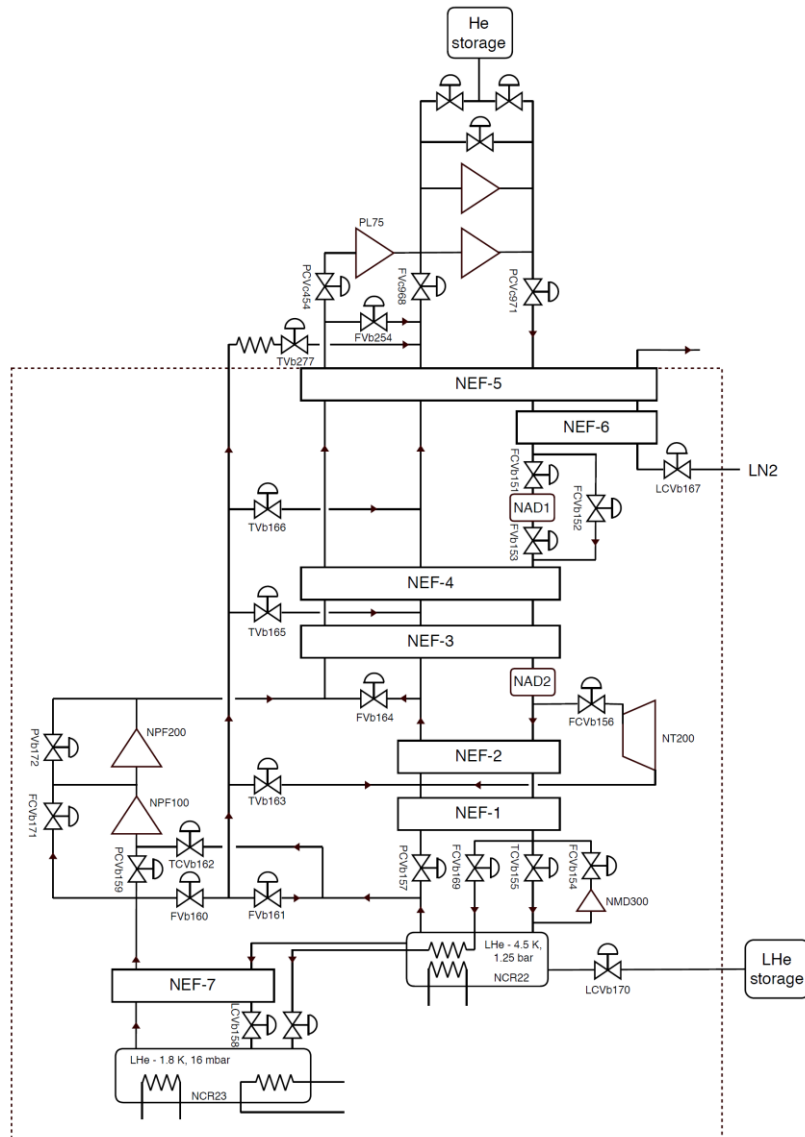

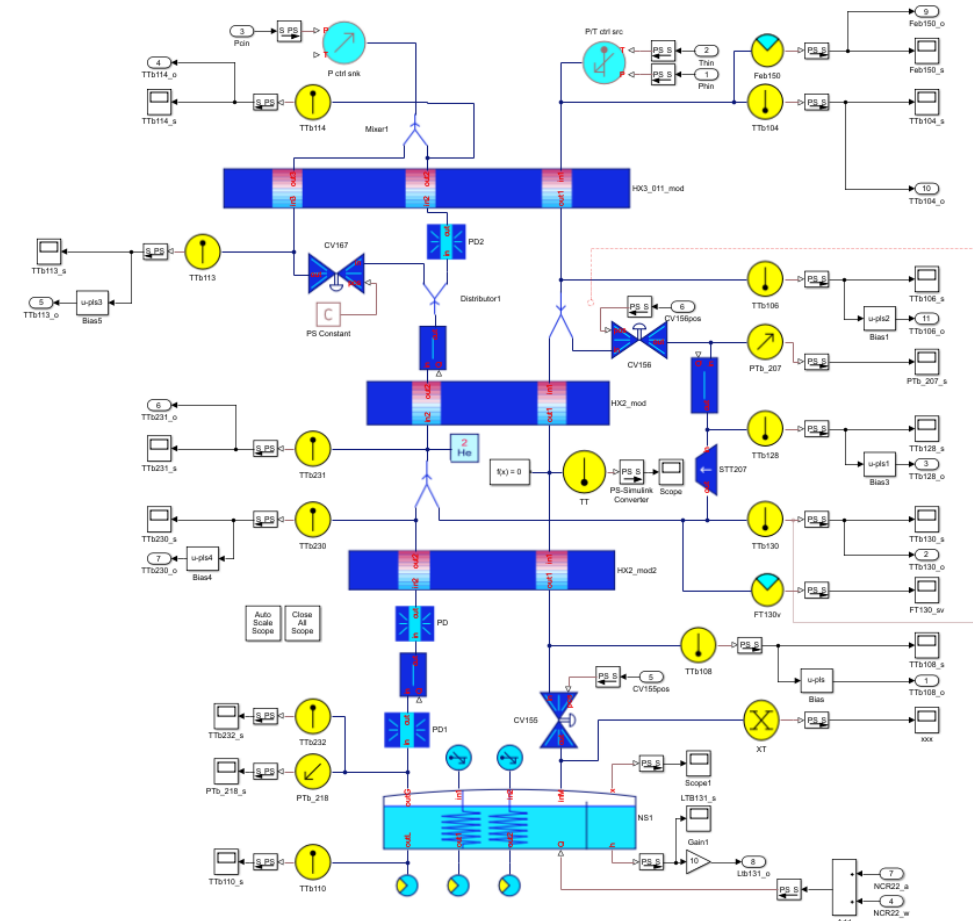

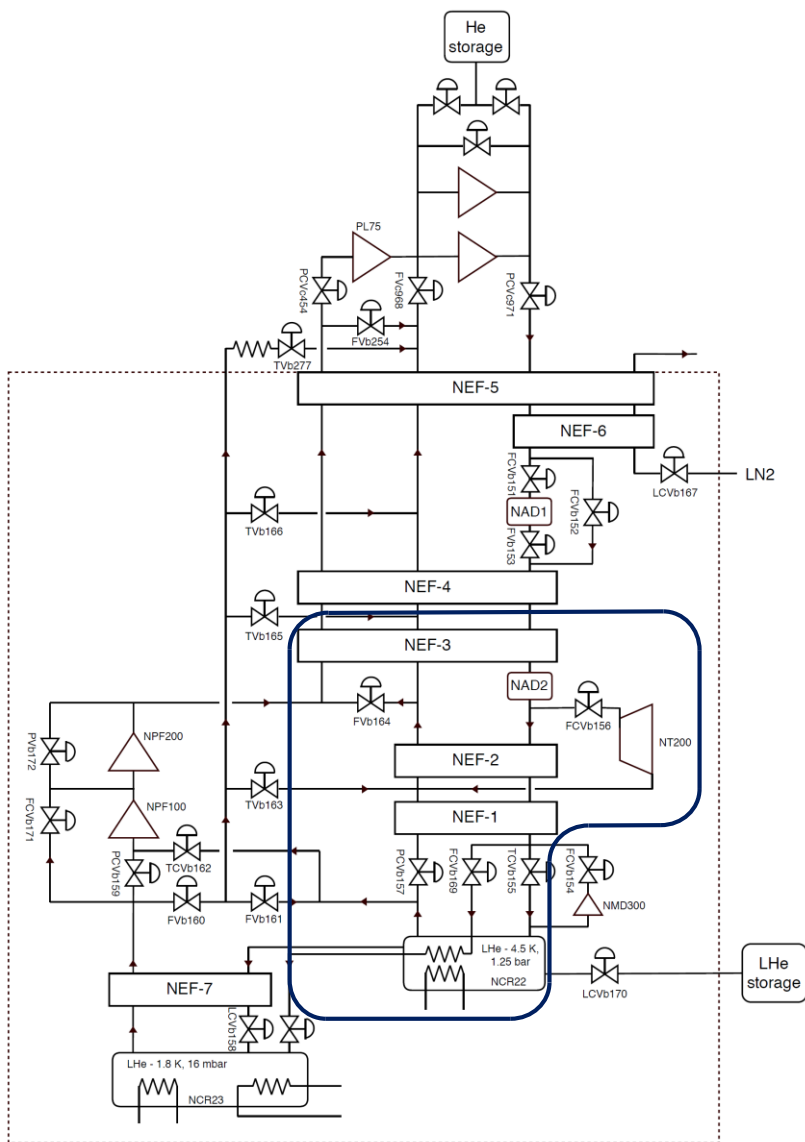

EASITrain – European Advanced Superconductivity Innovation and Training. This Marie Skłodowska-Curie Action (MSCA) Innovative Training Networks (ITN) has received funding from the European Union's H2020 Framework Programme under Grant Agreement no. 764879

- Study the process cycles of large cryogenic systems
- Develop the CEA modeling software SimCryogenics
- Validate the dynamic models with existing cryogenic plants
- Personal objectives (PhD, scientific development)

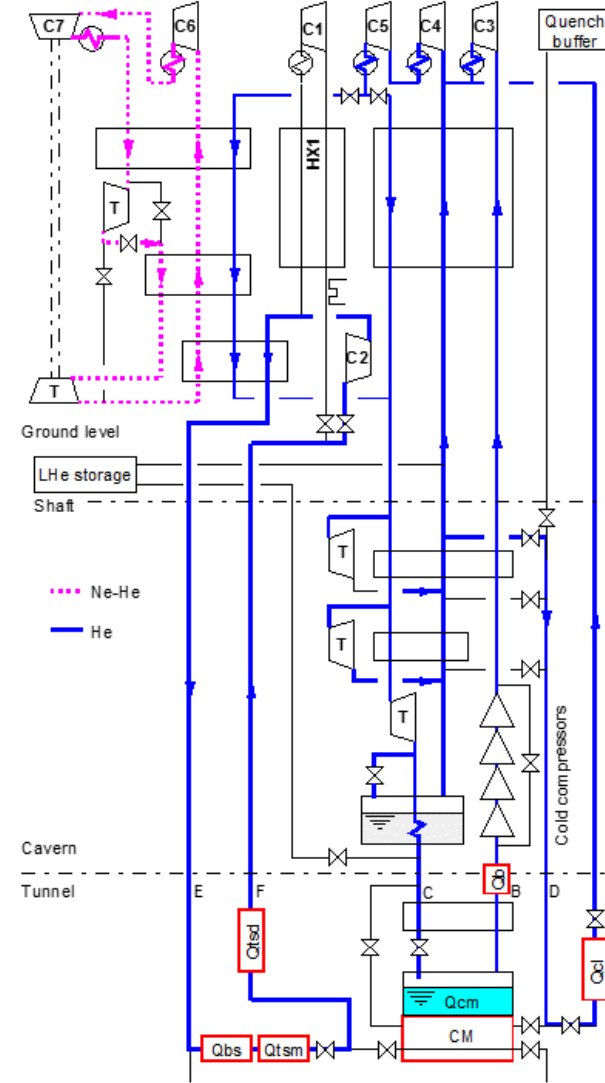

400 W @ 1.8 K CEA SBT plant

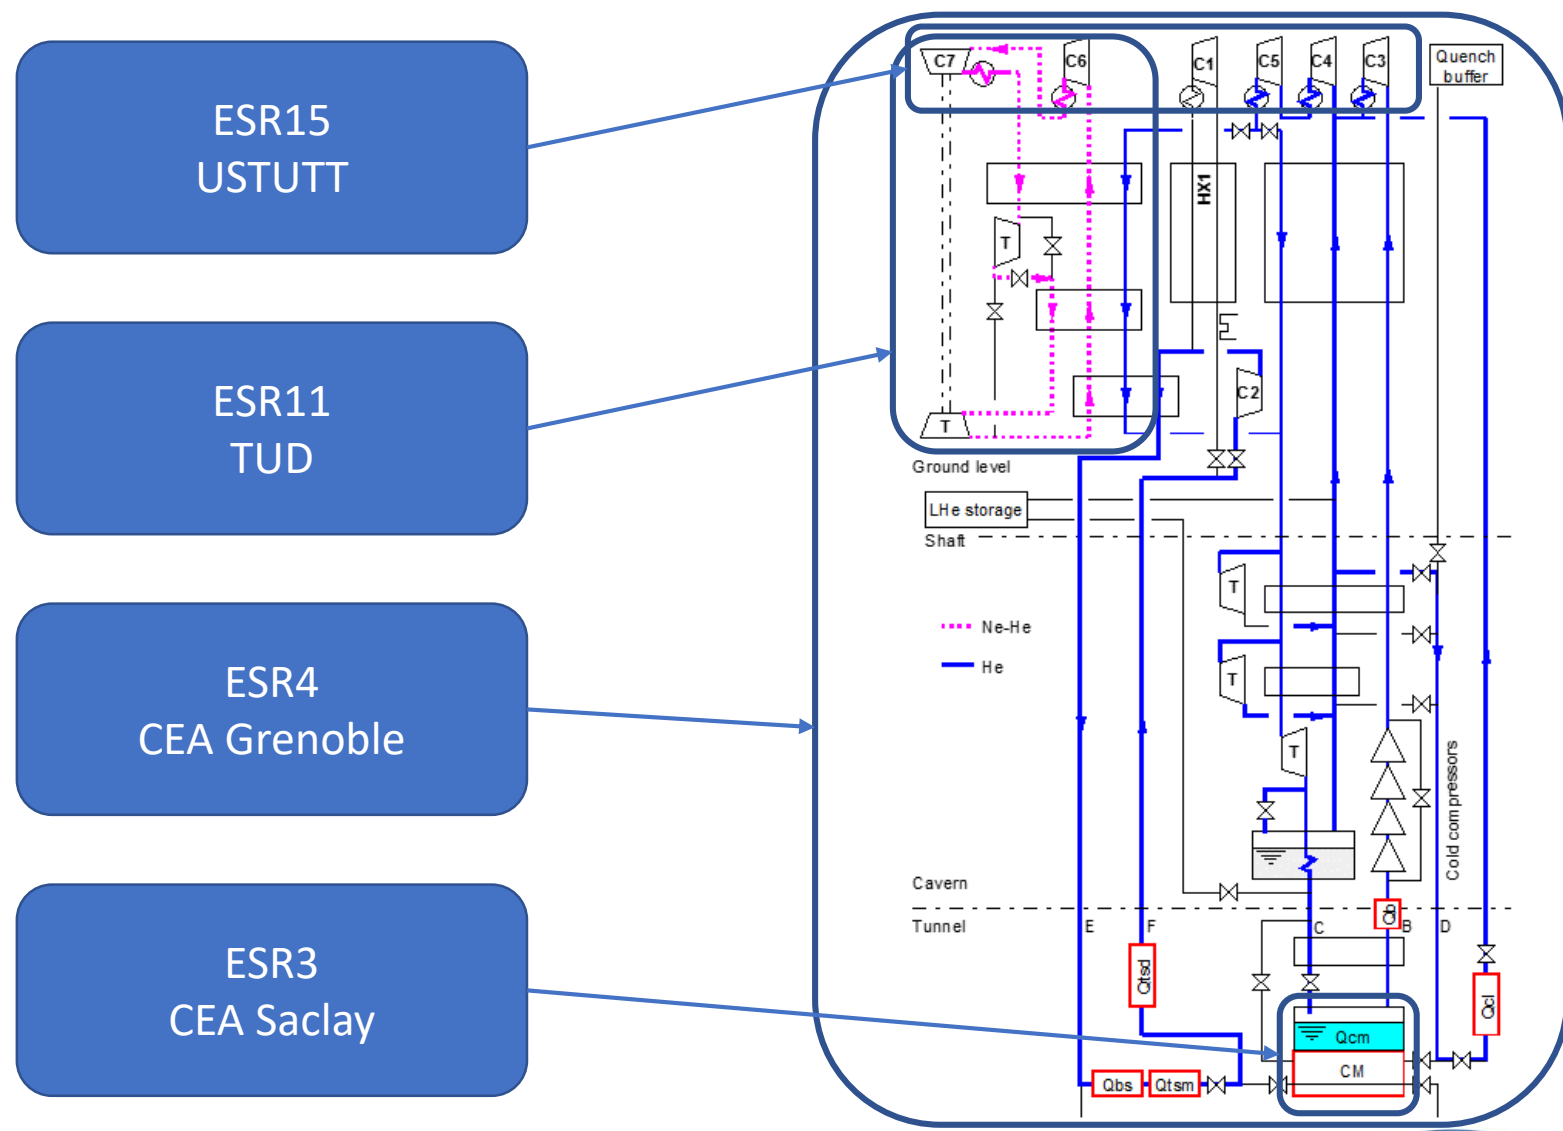

400 W @ 1.8 K CEA SBT plant

L. Taviani – Conceptual design of the refrigeration process cycle

Starting date: 1 March 2018

Years 2018/2019

- Model the centrifugal compressor as a part of large cryogenic system
- Develop a tool to model the mixed refrigerants cycle

Years 2019/2020

- Validate the dynamic model with existing facilities (single fluid and mixed refrigerants)

Years 2020/2021

- Valorization and thesis

University of Stuttgart
Germany

Challenges:

- Time constraints
 - Scientific challenges
 - SimCryogenics model valorization
-
- Cold compressor modelling
 - Mixed refrigerants database development
 - Model validation thanks to industry collaboration

Risks:

- Time
- Unsuccessful theory implementation

Thank you for your attention
