

Superconducting Tunnel Junction Detectors

International Workshop on Next Generation Nucleon Decay and Neutrino
Detectors (NNN17)

Oct. 26-28, 2017 University of Warwick, UK

Yuji Takeuchi

Tomonaga Center for History of the Universe, University of Tsukuba

Contents

- Introduction to Superconducting tunnel Junction (STJ)
- Cryogenic amplifier development using silicon-on-insulator for STJ signal amplification.
- Application of low energy threshold STJ
 - COBAND (cosmic background neutrino decay search)

Superconducting energy gap

In superconducting state, a pair of electrons around ϵ_F forms Cooper pair with binding energy of 2Δ . \rightarrow DOS has a gap energy.

	Si	Nb	Ta	Al	Hf
Tc[K]		9.23	4.48	1.20	0.165
Δ [meV]	1100	1.550	0.7	0.172	0.020

$$\Delta \sim 1.8 k_B T_c \text{ (BCS theory)}$$

Superconducting Tunnel Junction (STJ) Detector

Superconductor / **Insulator** / Superconductor
Josephson junction device

Δ : Superconducting gap energy

- A constant bias voltage ($|V| < 2\Delta/e$) is applied across the junction.
- An energy absorbed in the superconductor breaks Cooper pairs and creates tunneling current of quasi-particles proportional to the deposited energy.

STJ current-voltage curve

Tunnel current of Cooper pairs (Josephson current) is seen at $V=0$

STJ current-voltage curve

Tunnel current of Cooper pairs (Josephson current) is suppressed by applying magnetic field

STJ current-voltage curve

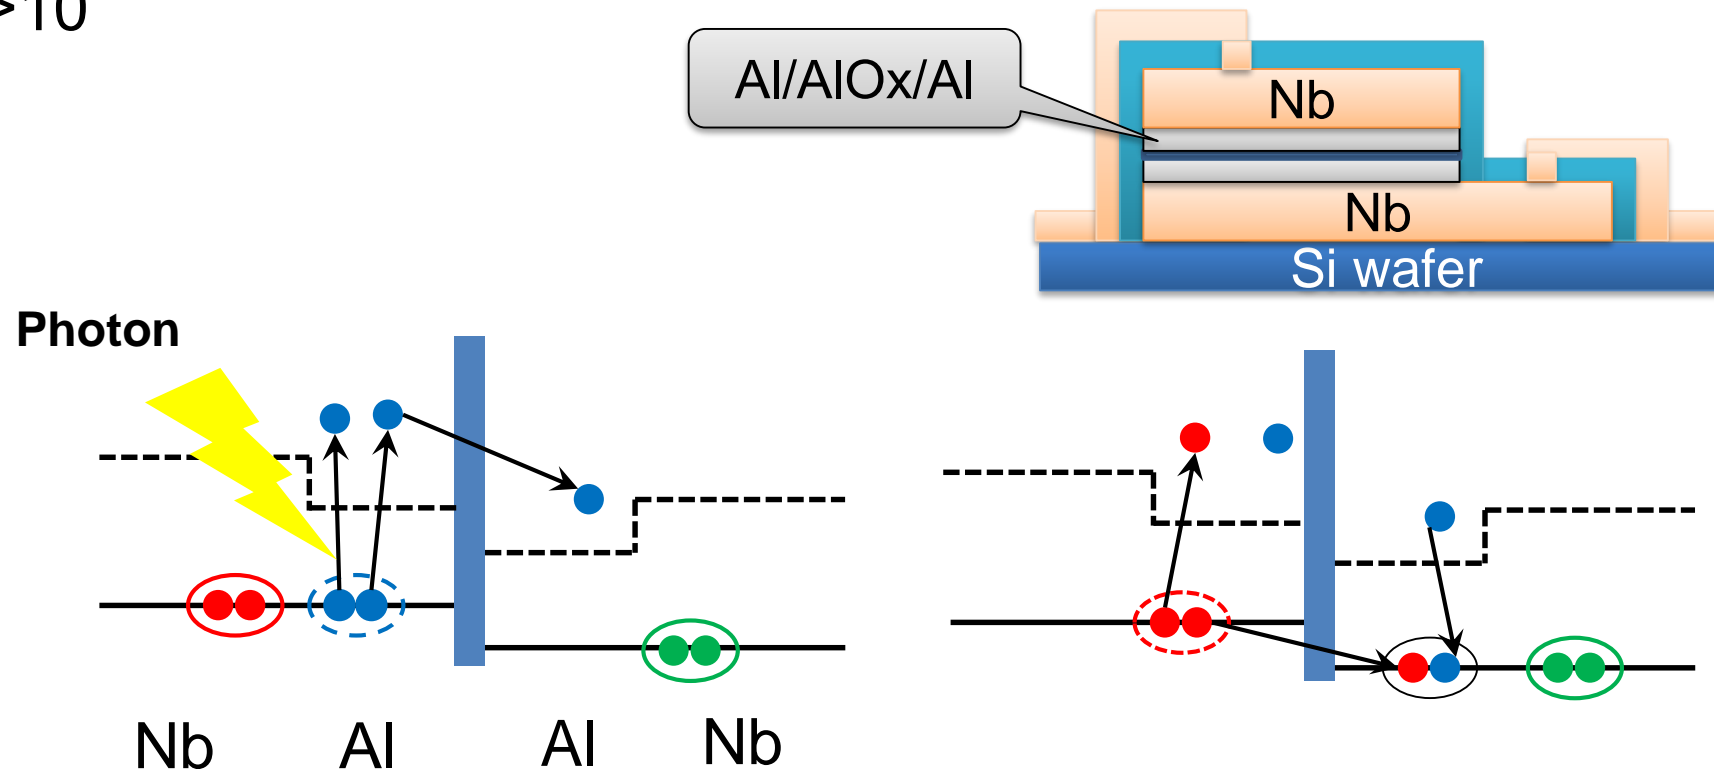

Signal readout

➔ Apply a constant bias voltage ($|V| < 2\Delta/e$) across the junction and collect tunnel current of quasi particles created by energy deposition

✓ Leak current causes background noise

STJ back-tunneling effect

- Bi-layer fabricated with superconductors of different gaps $\Delta_{\text{Nb}} > \Delta_{\text{Al}}$ to enhance quasi-particle density near the barrier
 - Quasi-particle near the barrier can mediate **multiple Cooper pairs**
- Nb/Al-STJ Nb(200nm)/Al(70nm)/AlOx/Al(70nm)/Nb(200nm)
- Gain: >10

Nb/Al-STJ development at AIST/CRAVITY

50 μ m sq. Nb/Al-STJ fabricated at CRAVITY

- $I_{leak} \sim 200$ pA for 50 μ m sq. STJ, and achieved 50 pA for 20 μ m sq.

Need $\sim 1/10 T_c$ for practical operation

Nb/Al-STJ response to pulsed laser

Nb/Al-STJ response to pulsed laser (465nm)
CRAVITY Nb/Al-STJ 100um sq.

- Nb/Al-STJ has $\sim 1\mu\text{s}$ response time.

Nb/Al-STJ has faster response than other superconductor based detectors
➔ suitable for single photon (single particle) detection

STJ energy resolution

Signal = Number of quasi-particles created by cooper pair breakings

$$\frac{E_\gamma}{1.7\Delta}$$

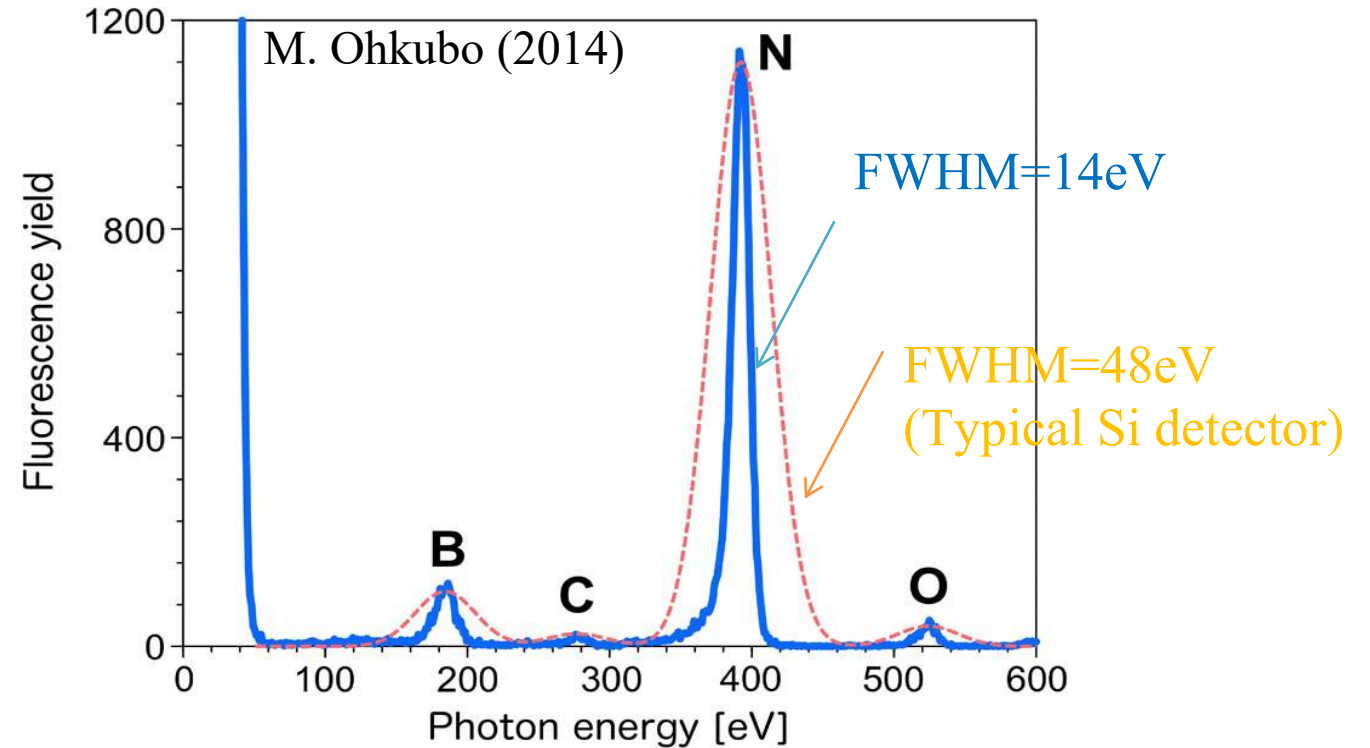

Resolution = Statistical fluctuation in number of quasi-particles

$$\sigma_E \sim \sqrt{(1.7\Delta)FE}$$

→ Smaller superconducting gap energy Δ yields better energy resolution, but need smaller T_c

Δ : Superconducting gap energy
F: fano factor
E: Deposited energy

STJ energy resolution for X-ray

- 100-pixel Nb/Al-STJ of 200 μ m sq. size (4mm² in total) fabricated at CRAVITY
- X-ray Absorption Fine Structure (XAFS) Spectrometry in Synchrotron Radiation Facilities
- X-ray fluorescence spectra for BN sample with C and O contamination by the STJ

In this energy region, however, transition edge sensor (TES) gives best energy resolution: $\Delta E = 1.6\text{eV}$ @ $E=6\text{keV}$

STJ energy resolution for near infrared photon

P. Verhoeve et. al 1997

- 30 μm sq. Ta/Al-STJ
- $\Delta E \sim 130 \text{ meV}$ @ $E = 620 \text{ meV} (\lambda = 2 \mu\text{m})$
- Charge sensitive amplifier at room temp.
- Electronic noise $\sim 100 \text{ meV}$

In sub-eV ~ several-eV region, STJ gives the best energy resolution among superconductor based detectors, but limited by readout electronic noise.

STJ summary

- Typical size: $10\mu\text{m}\sim 200\mu\text{m}$ square size \times $100\text{nm}\sim 1\mu\text{m}$ thickness per pixel
 - AIST group achieved 100-pixel STJ sensor
- Need magnetic field $\sim 100\text{gauss}$
- Operate typically at $1/10 \times T_c$
- Superconductor with smaller Δ is better, but it has smaller T_c
- Wide energy range: $\text{meV} \sim \text{keV}$
 - Suitable usage of the STJ is single photon/particle detection in sub-eV \sim several-eV
- In sub-eV range, the energy resolution is limited by readout electronic noise

STJ summary

- In sub-eV range, the energy resolution is limited by readout electronic noise

COBAND collaboration is developing cryogenic amplifier to amplify STJ signal at cold stage

FD-SOI-MOSFET at cryogenic temperature

FD-SOI : **F**ully **D**epleted – **S**ilicon **O**n **I**nsulator

- ❑ Very thin channel layer in MOSFET on SiO_2
- ❑ No floating body effect caused by charge accumulation in the body
- ❑ FD-SOI-MOSFET is reported to work at 4K

JAXA/ISIS AIPC 1185,286-289(2009)
J Low Temp Phys 167, 602 (2012)

I_d - V_g curve of $W/L=10\mu\text{m}/0.4\mu\text{m}$ at $|V_{ds}|=1.8\text{V}$

Both p-MOS and n-MOS show excellent performance at 3K and below.

SOI prototype amplifier for demonstration test

Test pulse input through $C=1\text{nF}$ at $T=350\text{mK}$

- Power consumption: $\sim 100\mu\text{W}$
- Output load: $1\text{M}\Omega$ and $\sim 0.5\text{nF}$

STJ response to laser pulse amplified by Cold amplifier

Connect 20μm sq. Nb/Al-STJ and SOI amplifier on the cold stage through a capacitance

STJ response to laser pulse amplified by Cold amplifier

Demonstrated to show amplification of Nb/Al-STJ response to laser pulse by SOI amplifier situated close to STJ at T=350mK

Development of SOI cryogenic amplifier for STJ signal readout is now moving to the stage of design for practical usage!

COBAND (COsmic BAckground Neutrino Decay)

Search for **Neutrino decay** in **Cosmic background neutrino**

→ To be observed as far infrared photons of $\lambda \sim 50 \mu\text{m}$ ($E \sim 25 \text{meV}$)

COBAND (COsmic BAckground Neutrino Decay)

Search for **Neutrino decay** in **Cosmic background neutrino**

→ To be observed as far infrared photons of $\lambda \sim 50 \mu\text{m}$ ($E \sim 25 \text{meV}$)

$$\tau = 1 \times 10^{14} \text{ yrs}$$
$$m_3 = 50 \text{ meV}$$

COBAND (COsmic BAckground Neutrino Decay)

Search for **Neutrino decay** in **Cosmic background neutrino**

→ To be observed as far infrared photons of $\lambda \sim 50 \mu\text{m}$ ($E \sim 25 \text{meV}$)

COBAND Rocket Experiment

- 200-sec measurement at an altitude of 200~300km
- Aiming at a sensitivity to 10^{14} years for the neutrino lifetime

COBAND rocket experiment sensitivity

- 200-sec measurements with a sounding rocket
- 15cm dia. and 1m focal length telescope and grating in 40~80 μ m range
- Each pixel in 100 μ m \times 100 μ m \times 8 \times 50pix. array **counts number of photons**

Sub-GeV Dark Matter Search

- Target: ^{93}Nb (92.9u) $100\mu\text{m} \times 100\mu\text{m} \times 1\mu\text{m} \times 10\text{pix}$
- Measurement time: 10000 sec ($\sim 2.8\text{hours}$)
- Assume negligible dark count above **350meV threshold**

Summary

- STJ is the most powerful detector for energy detection in sub-eV ~ several-eV, though it has weakness in its small sensitive area
- SOI Cryogenic amplifiers for STJ readout is under development and we performed demonstration of STJ signal amplification by a prototype SOI amplifier at $T \sim 350\text{mK}$.
 - SOI cryogenic amplifier is expected to extract maximum potential of STJ
- COBAND collaboration propose an experimental search for neutrino radiative decay in cosmic neutrino background using STJ.

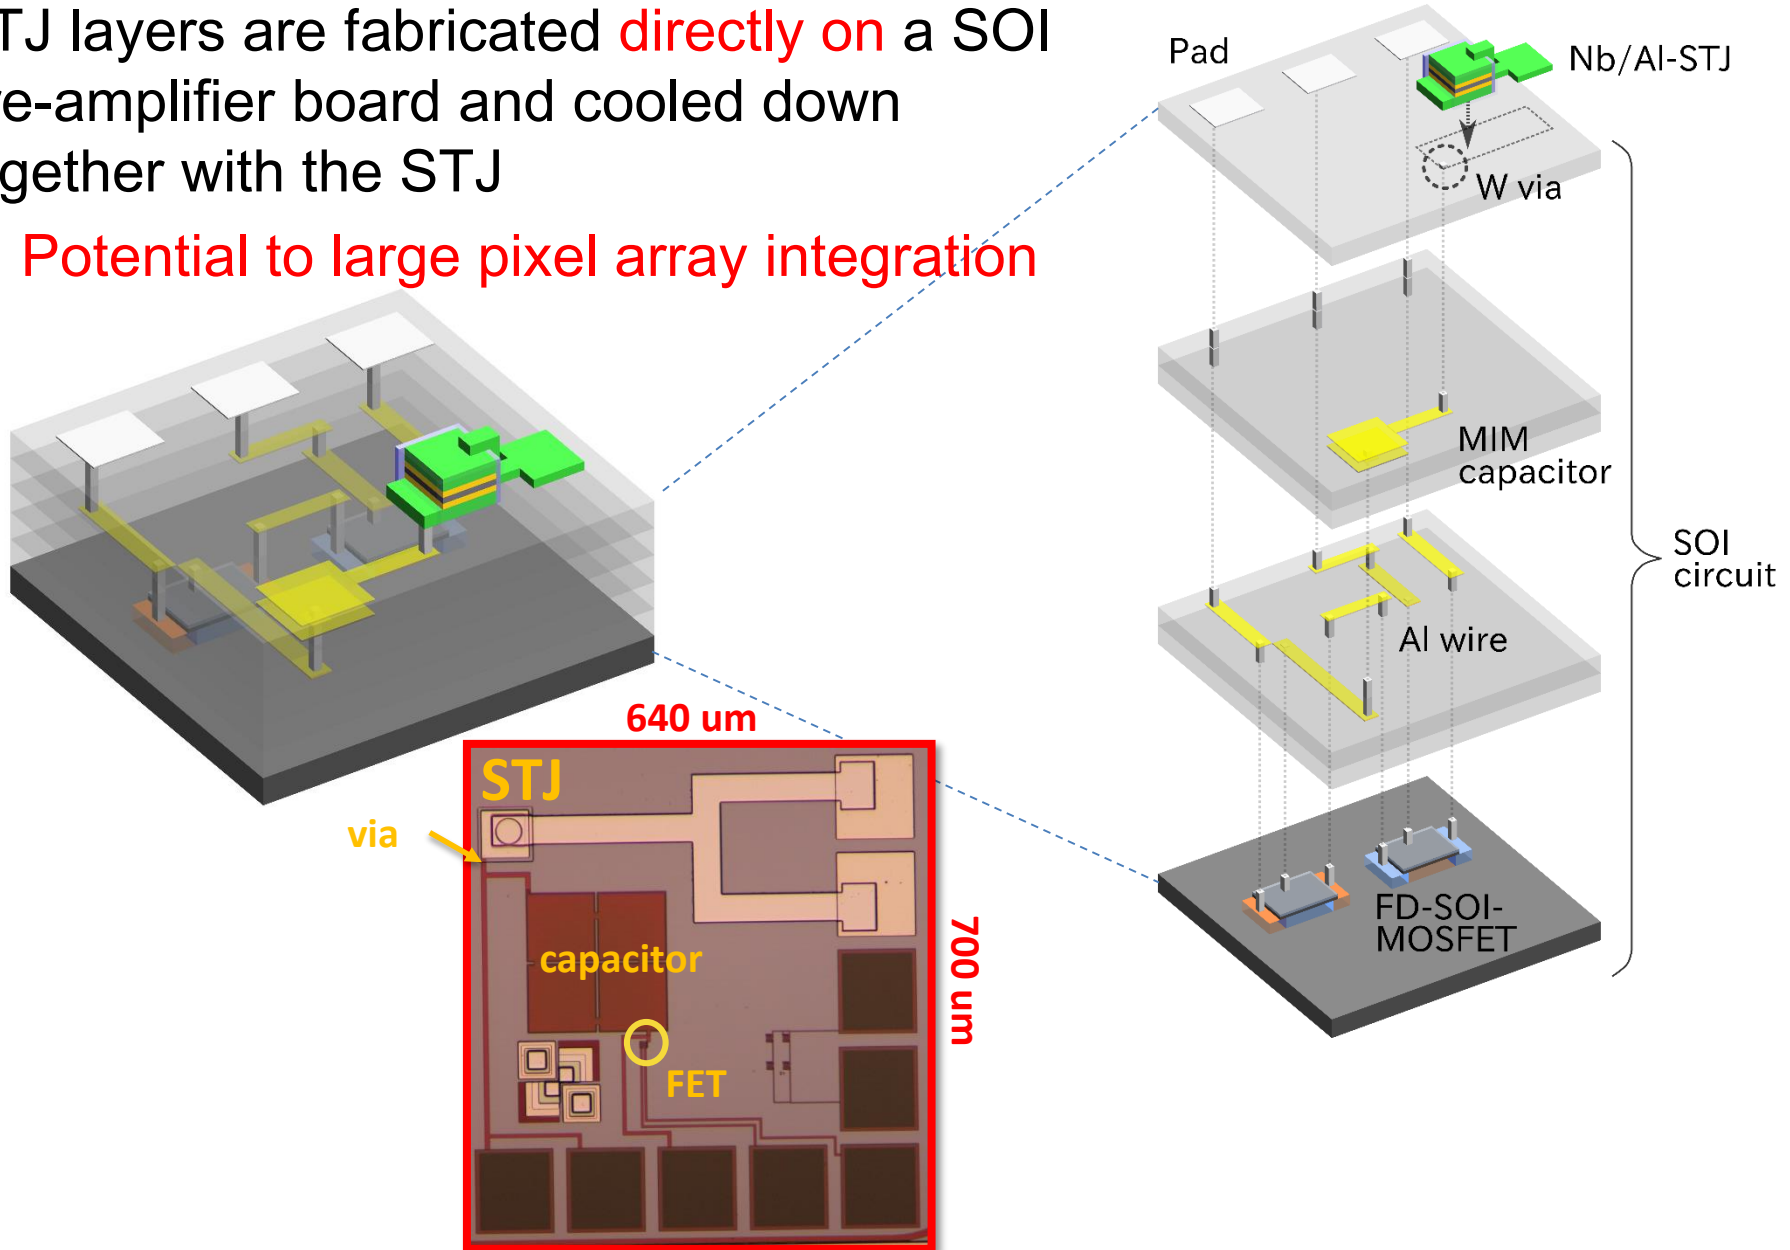

STJ with SOI cryogenic amplifier has a potential to be the most powerful low energy threshold detector.

Backup

SOI增幅回路一体型STJ検出器(SOI-STJ)

STJ layers are fabricated **directly on** a SOI pre-amplifier board and cooled down together with the STJ

- **Potential to large pixel array integration**

FD-SOI on which STJ is fabricated

nMOS-FET in FD-SOI wafer on which a STJ is fabricated at KEK

I-V curve of a STJ fabricated at KEK on a FD-SOI wafer

- Both nMOS and pMOS-FET in FD-SOI wafer on which a STJ is fabricated work fine at temperature down below 1K
- Nb/Al-STJ fabricated at KEK on FD-SOI works fine
- We are also developing SOI-STJ where STJ is fabricated at CRAVITY

Cosmic neutrino background (CνB)

CMB

$$n_\gamma = 411/\text{cm}^3$$

$$T_\gamma = 2.73 \text{ K}$$

CνB (=neutrino decoupling)
~1s after the big bang

$$T_\nu = \left(\frac{4}{11}\right)^{\frac{1}{3}} T_\gamma = 1.95 \text{ K}$$

$$\langle p_\nu \rangle = 0.5 \text{ meV}/c$$

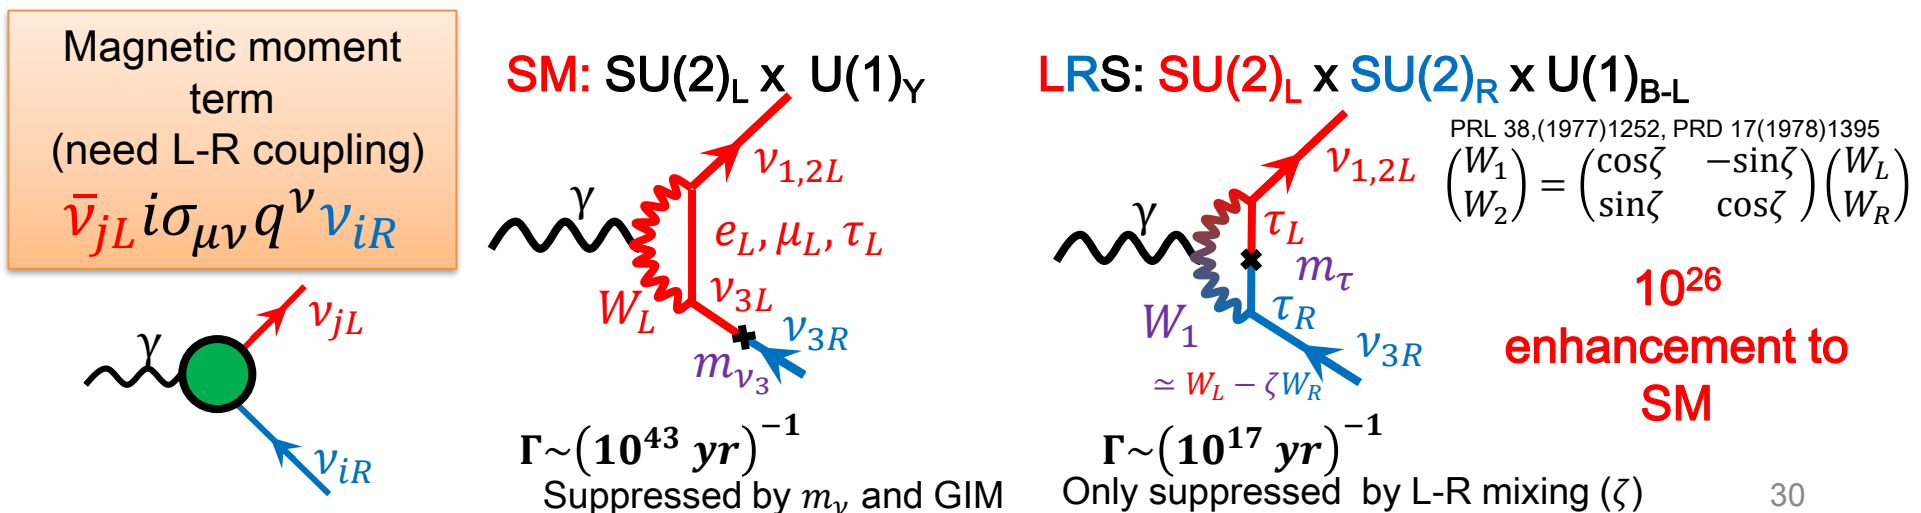

$$n_\nu + n_{\bar{\nu}} = \frac{3}{4} \left(\frac{T_\nu}{T_\gamma}\right)^3 n_\gamma = 110/\text{cm}^3$$

The Particle Universe

Motivation of ν -decay search in C ν B

- Search for $\nu_3 \rightarrow \nu_{1,2} + \gamma$ in cosmic neutrino background (C ν B)
 - Search for anomalous magnetic moment of neutrino
 - Direct detection of C ν B
 - Determination of neutrino mass: $m_3 = (m_3^2 - m_{1,2}^2)/2E_\gamma$
- Aiming at a sensitivity to ν lifetime for $\tau(\nu_3) = O(10^{17} \text{ yrs})$
 - Standard Model expectation: $\tau = O(10^{43} \text{ yrs})$
 - Experimental lower limit: $\tau > O(10^{12} \text{ yrs})$
 - L-R symmetric model (for Dirac neutrino) predicts down to $\tau = O(10^{17} \text{ yrs})$ for W_L - W_R mixing angle $\zeta < 0.02$

Photon Energy (Wavelength) in Neutrino Decay

$$\nu_3 \rightarrow \nu_{1,2} + \gamma$$

in the ν_3 rest frame

- From neutrino oscillation
 - $|\Delta m_{23}^2| = |m_3^2 - m_2^2| \sim 2.4 \times 10^{-3} \text{ eV}^2$
 - $\Delta m_{12}^2 \sim 7.65 \times 10^{-5} \text{ eV}^2$
- From Planck+WP+highL+BAO
 - $\sum m_i < 0.23 \text{ eV}$

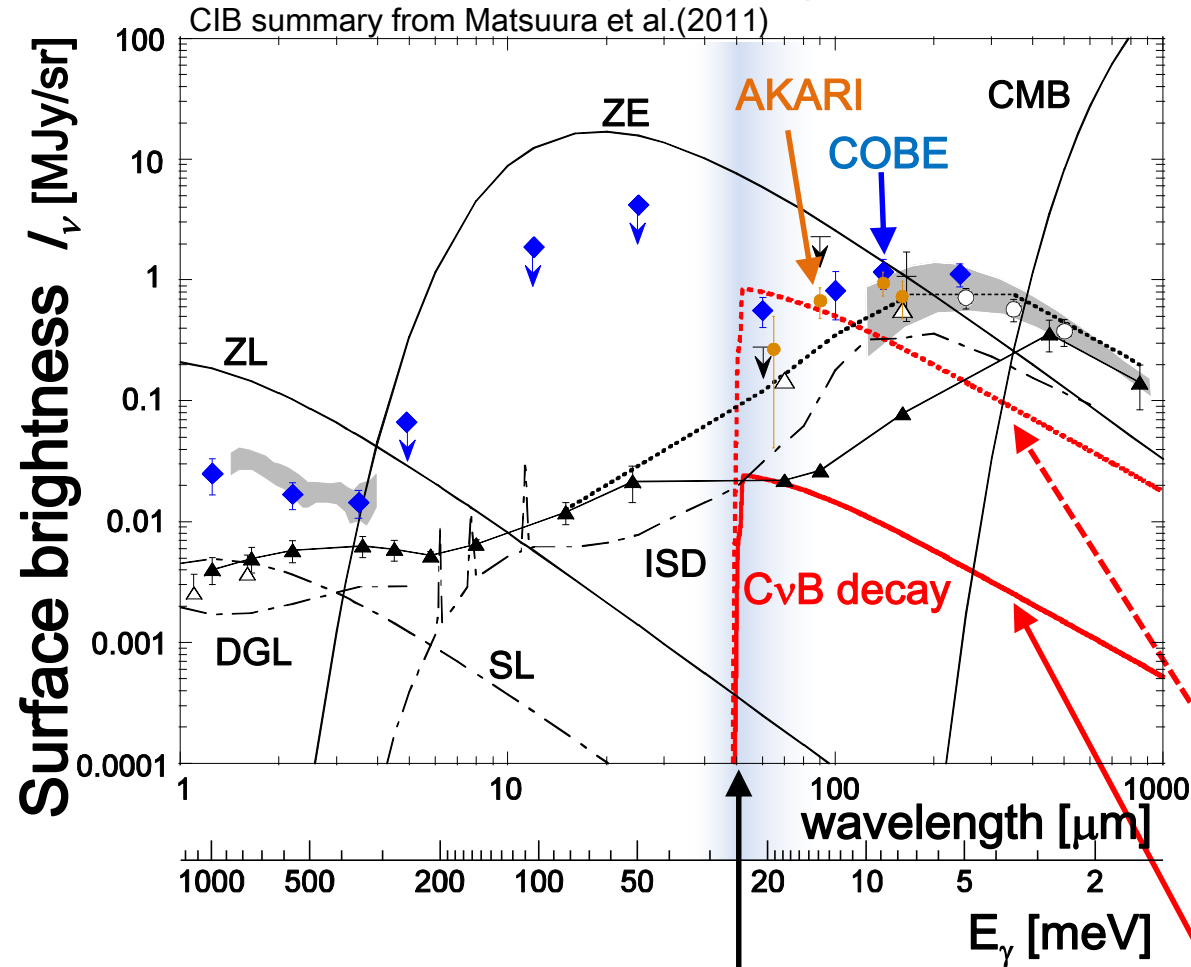

$$\rightarrow 50 \text{ meV} < m_3 < 87 \text{ meV}$$

$$E_\gamma^{\text{rest}} = 14 \sim 24 \text{ meV} (\lambda_\gamma = 51 \sim 89 \mu\text{m})$$

λ_γ distribution in $\nu_3 \rightarrow \nu_2 + \gamma$

C ν B decay signal and Backgrounds

at $\lambda = 50\mu\text{m}$

Zodiacal Emission(ZE)

$$I_\nu \sim 8 \text{ MJy/sr}$$

CIB

$$\lambda I_\lambda \sim 0.1\text{-}0.5 \text{ MJy/sr}$$

C ν B decay

Expected E_γ spectrum

$$m_3 = 50 \text{ meV}$$

$$\tau = 3 \times 10^{12} \text{ yrs}$$

$$I_\nu \sim 0.8 \text{ MJy/sr}$$

Excluded by S.H.Kim et. al 2012

$$\tau = 1 \times 10^{14} \text{ yrs}$$

$$I_\nu \sim 25 \text{ kJy/sr}$$
