MD2202

BBLR compensation using DC wires

Summary and preliminary results

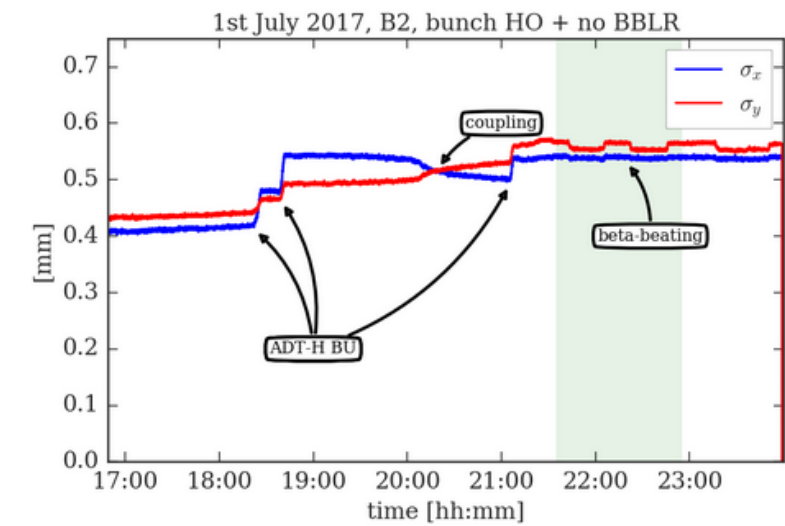

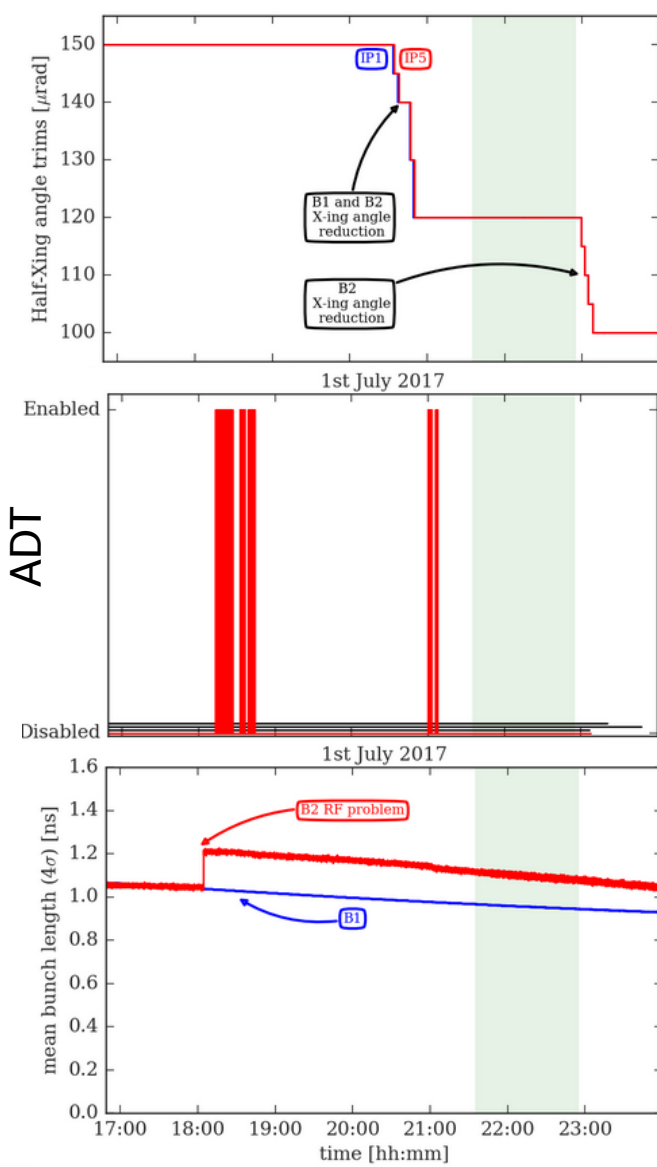

(almost a collection of plots to discuss together)

K. Skoufaris, Y. Papaphilippou, A. Rossi, S. Fartoukh, D. Pellegrini, K. Karastatis, A. Poyet, A. Valishev, S. Kostoglou, G. Sterbini, S. Papadopoulou, M. Fitterer, M. Solfaroli, M. Pojer, M. Hostettler, B. Salvachua, L. Carver, X. Buffat, P. Zisopoulos, H. Bartosik, N. Fuster, S. Redaelli, R. Bruce, M. Gonzales, G. Trad, M. Gasior, C. Zamatzas, J. Olexa, T. Levens, C. Xu, A. Gorzawski, D. Valuch, D. Amorim, I. Lamas Garcia, G. Cattenoz, E. Effinger, L. Poncet, D. Mirarchi, R. Tomas, D. Kaltchev, R. Jones, F. Schmidt [random order ;), sorry if I forgot someone]

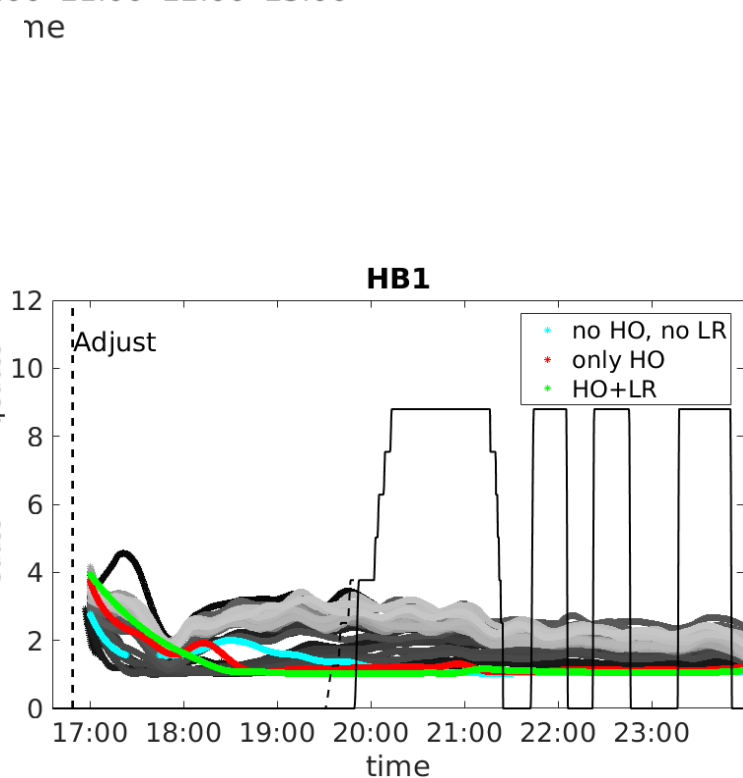

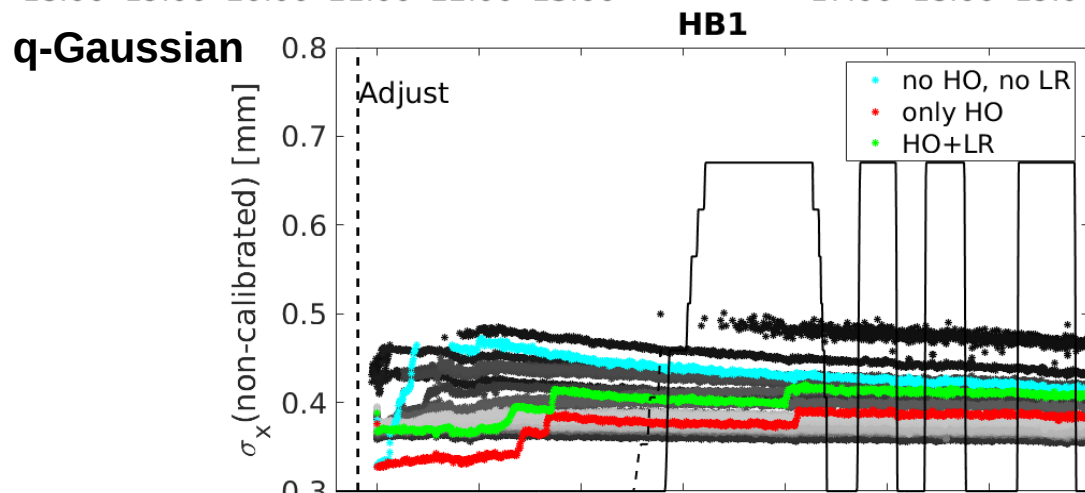

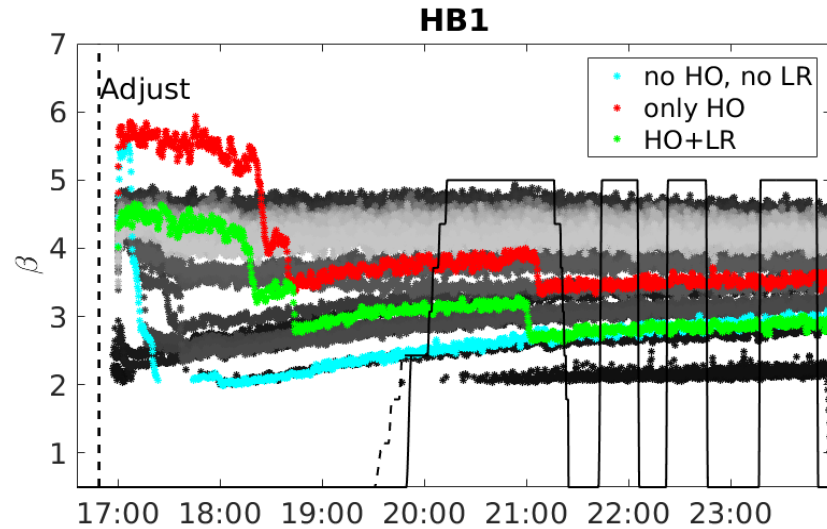

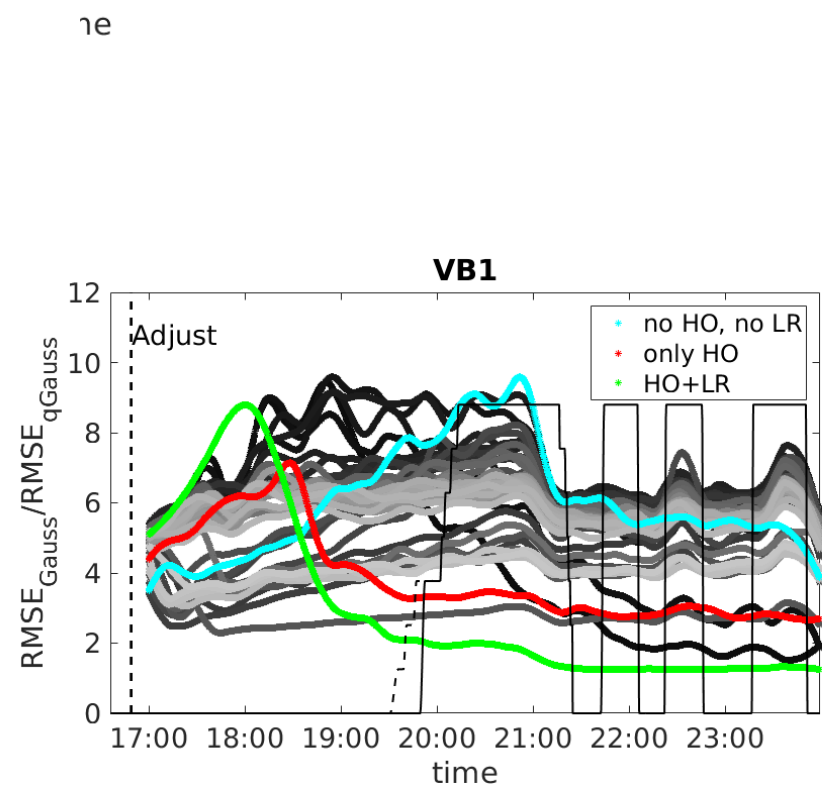

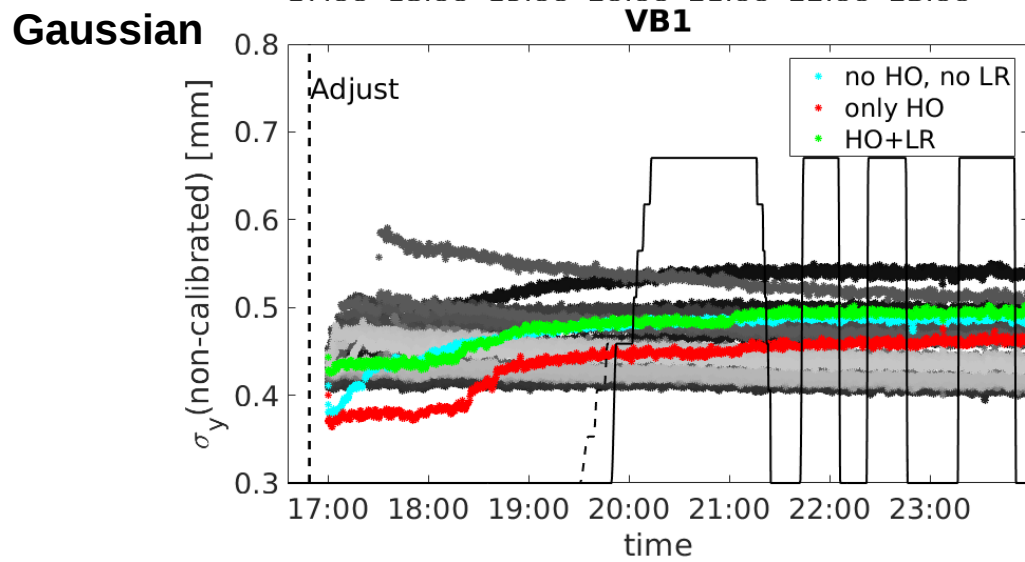

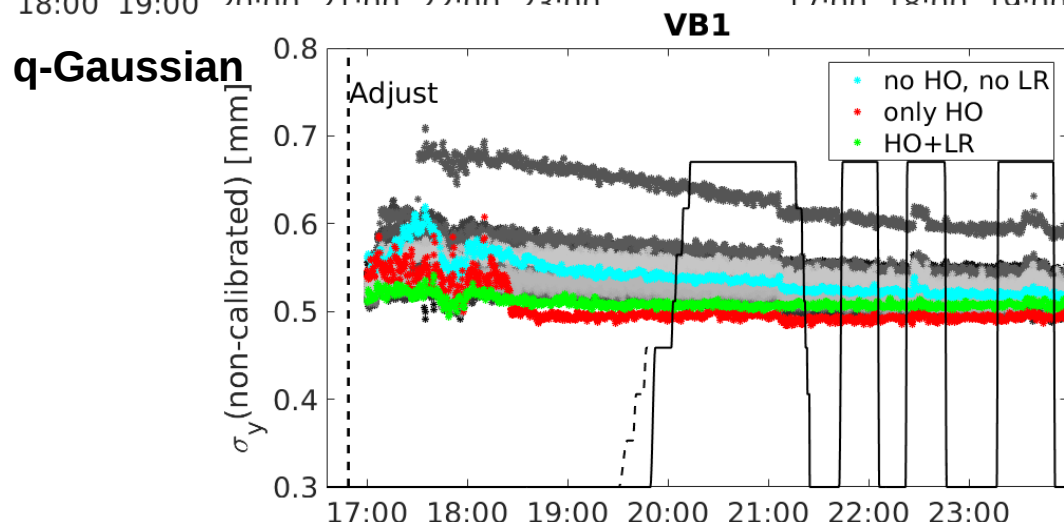

- We had two fills as foreseen ;) but we could use only FILL5900 (B2 weak beam).
- SPOILER: **a clear beneficial effect of the wire could be observed.**
- The analysis is only started: **comments/contributions are really appreciated!**
- Let us proceed per steps: we the MD earlier (1 h) so we could schedule an fast access to have the dBLM histogram on B2.

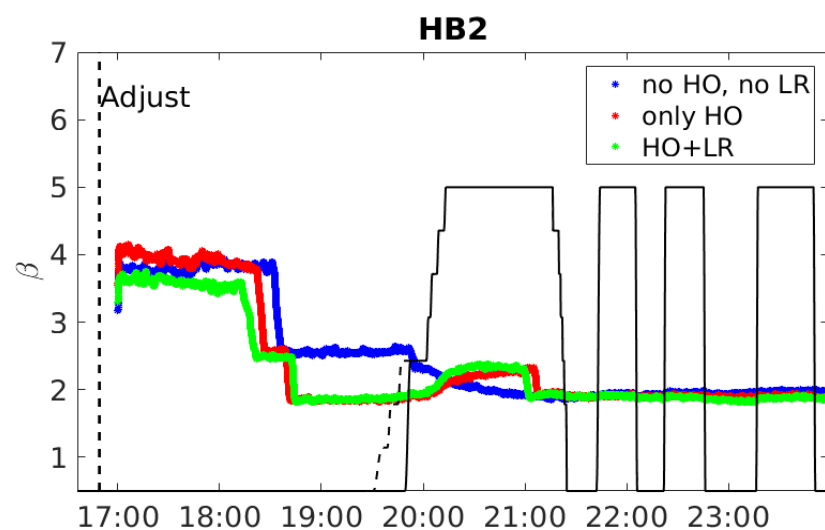

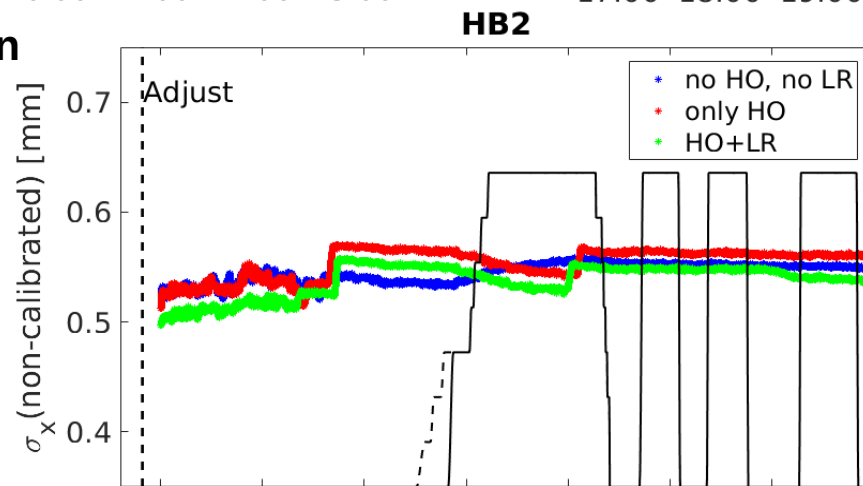

Transverse profiles

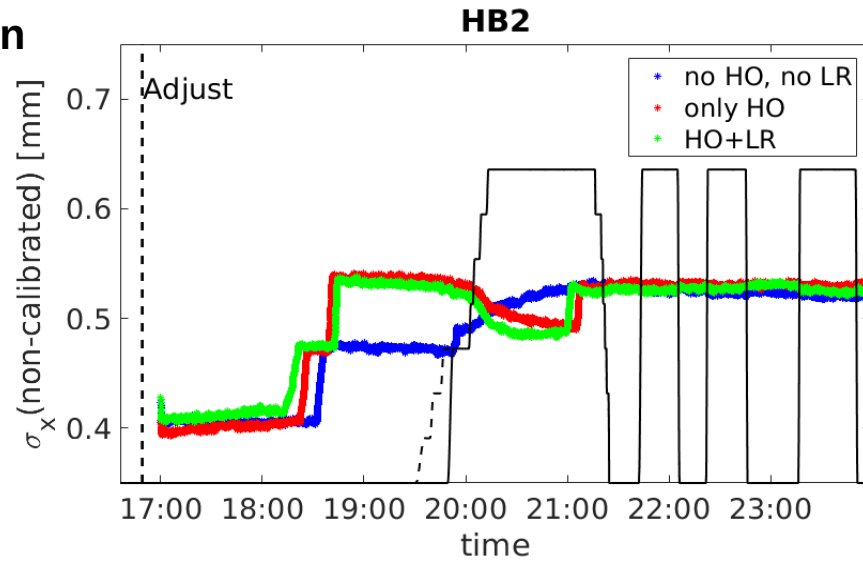

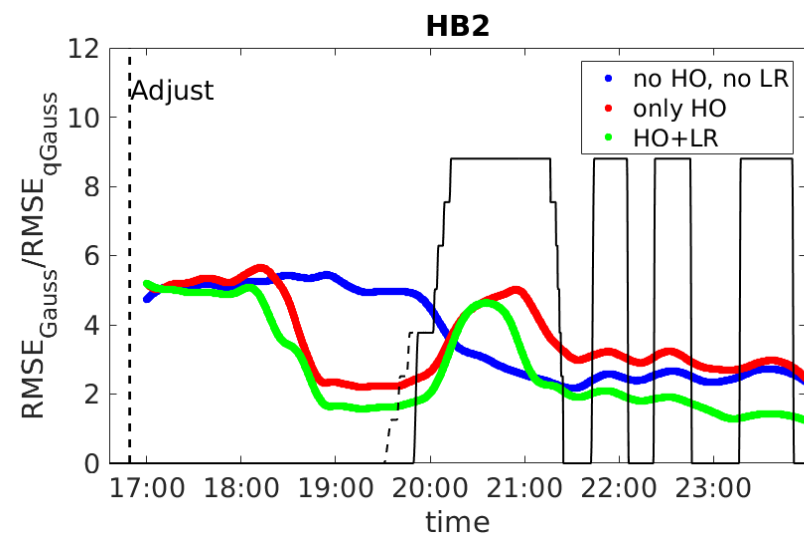

q-Gaussian

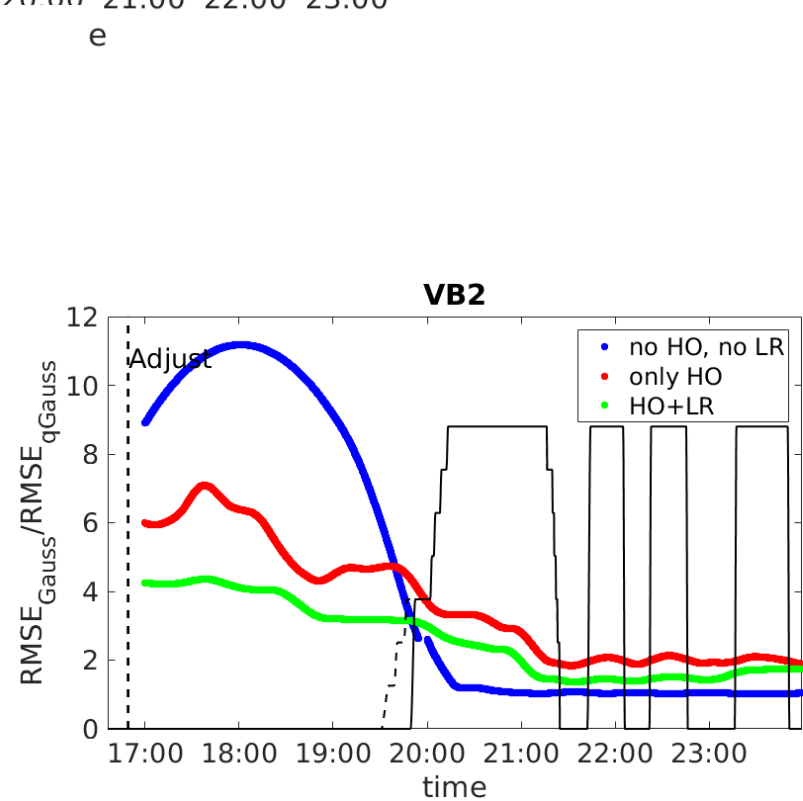

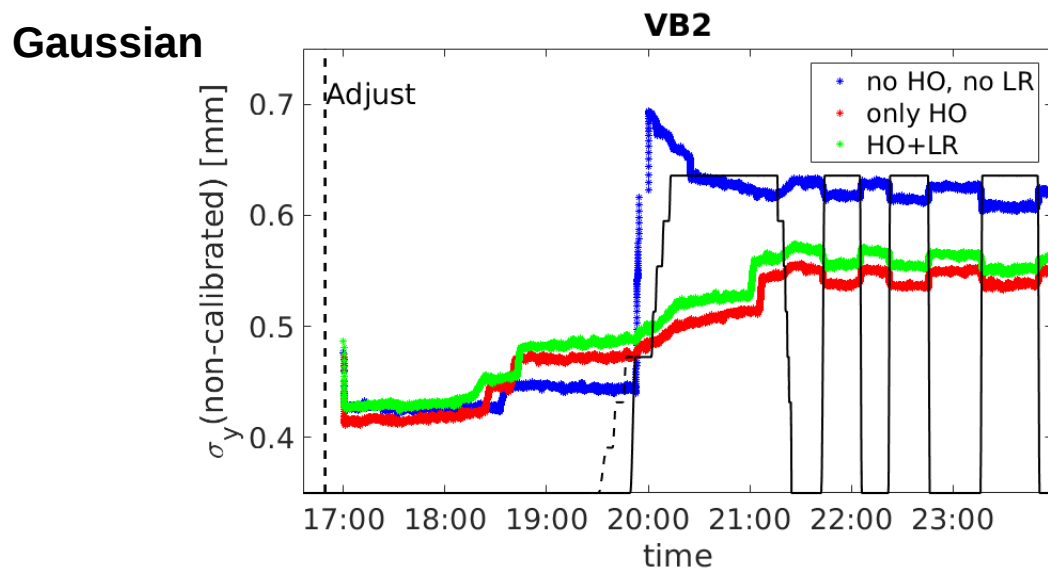

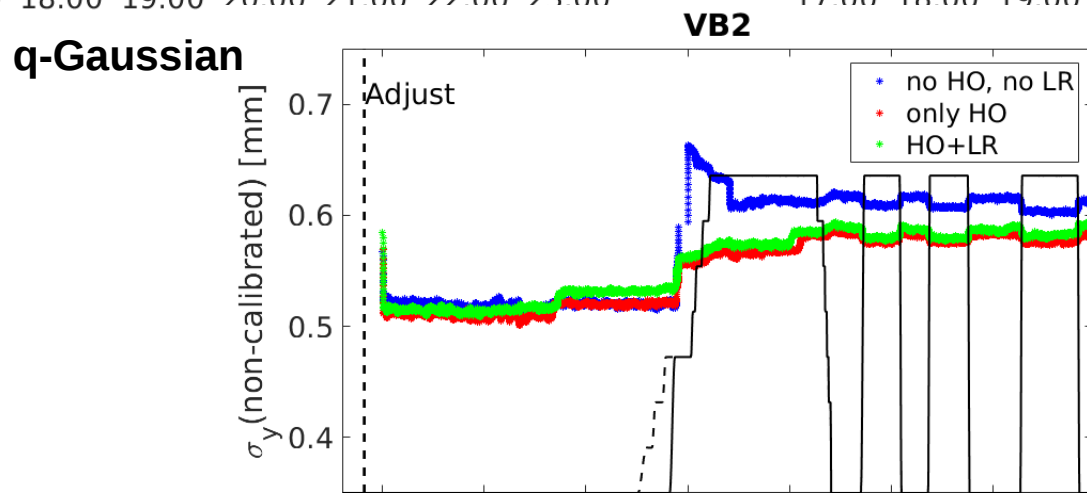

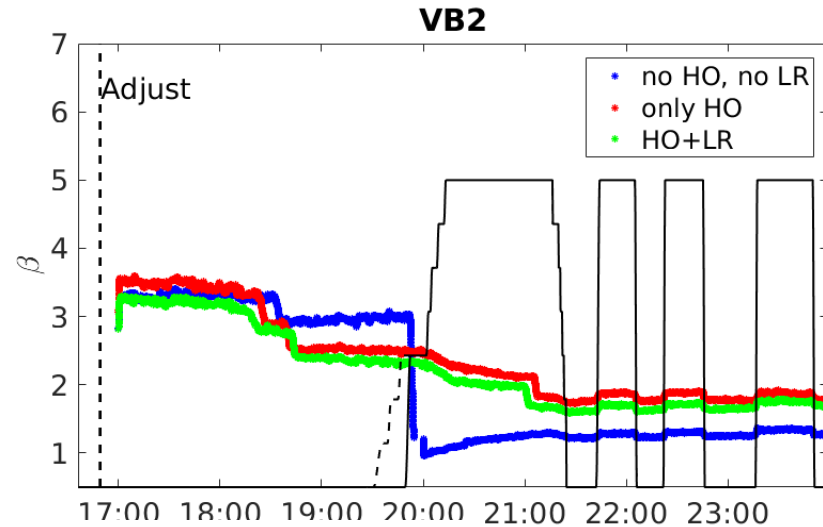

Gaussian

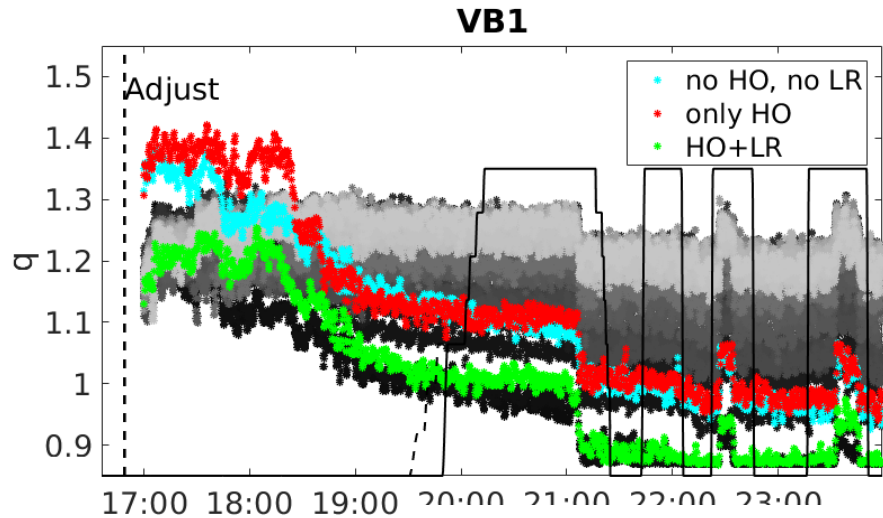

ie

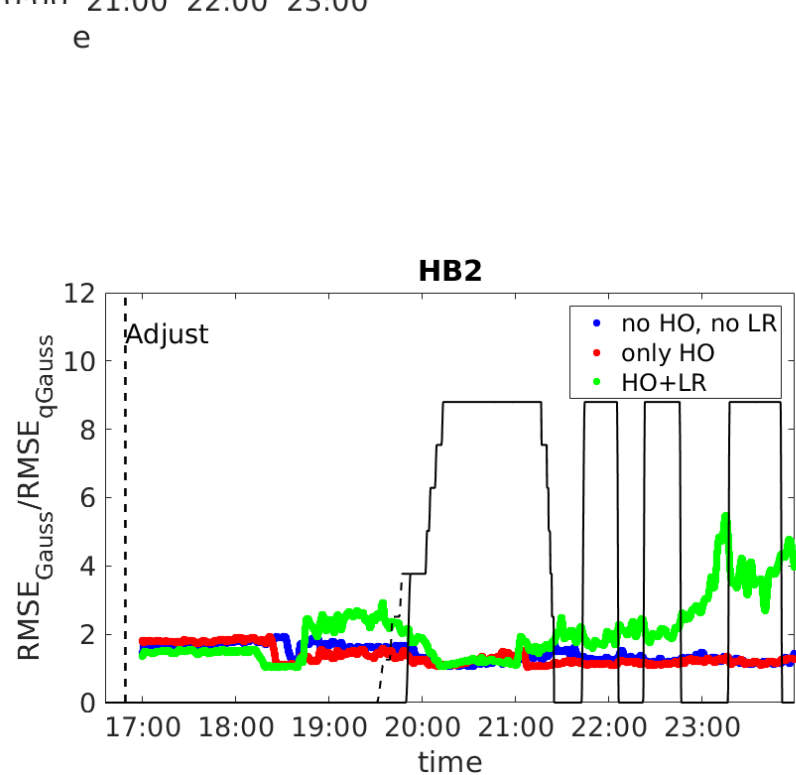

Transverse profiles (2 sigma cut)

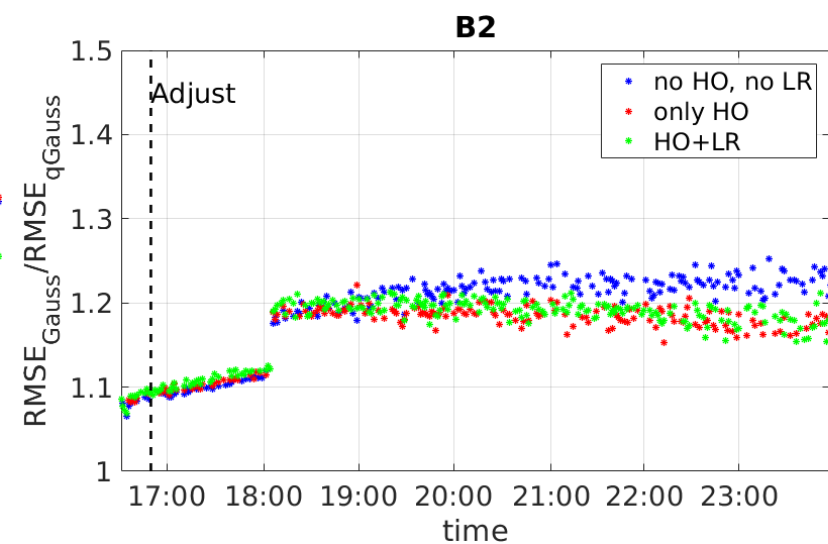

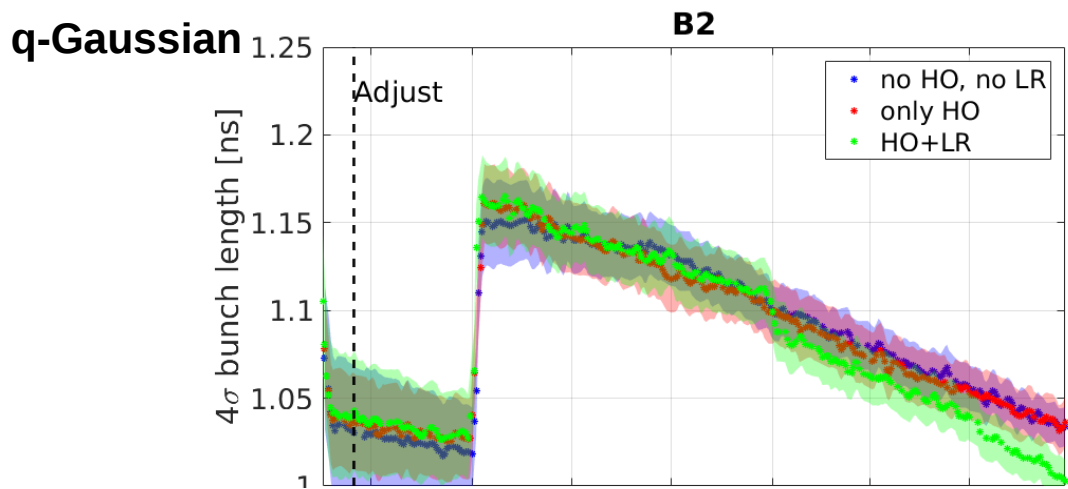

VB2**VB2****VB2**

ie

q-Gaussian**Gaussian****VB2**

Longitudinal profiles
(only for B2, because the B1 scope was broken)

Summary and next steps

MD2202

Transverse profiles (BSRT):

- Change of VB2 profiles when wire is switched on/off.
- What happens to VB1 around 21:10, 22:30 and 23:45?
- The profile analysis is done for the full transverse profiles and for a 2 sigma cut. Using the 2 sigma cut to avoid the tails (diffraction or other instrument effects), the Gaussian and q-Gaussian results have in general a better agreement ($q \rightarrow 1$) for HB1, HB2 and VB2. This is not the case for VB1, specially during the first 1 h after the Adjust.

Longitudinal profiles (only B2):

- B2 RF problem.
- A drop in the HO+LR bunch length due to losses (at ~21:00).

Transverse bunch profiles; BSRT and WS

- The LSF factor that is used to calibrate the beam size, is just a value to get the same emittance as for the WS. Even if it assumed to be a Gaussian for simplicity, in reality it is not. The BSRT and the WS profiles should be compared using the same fitting function, this is the only way to get an alternative LSF factor to be used for non-Gaussian distributions.
- The BSRT beams sizes at FT come from profiles that are fitted till the ~50% height of the right side of the distribution. Is that always true?

Longitudinal bunch profiles

- Discussions with Helga to use updated transfer functions for high intensity bunches.
