The 3D Hadron Structure

- ◆ Meson Form Factors
 - Most basic information about internal structure
- ◆ GPDs
 - Spatial imaging (exclusive DIS)
- ◆ TMDs
 - Confined motion in a nucleon (semi-inclusive DIS)
- ◆ Requires
 - High luminosity
 - Polarized beams and targets

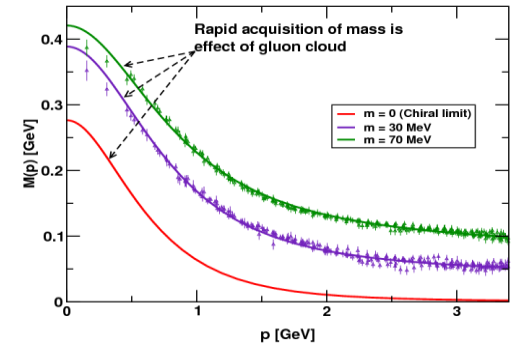

Major new capabilities with JLab12

Overview Form Factors

❑ **Pion and kaon form factors** are of special interest in hadron structure studies

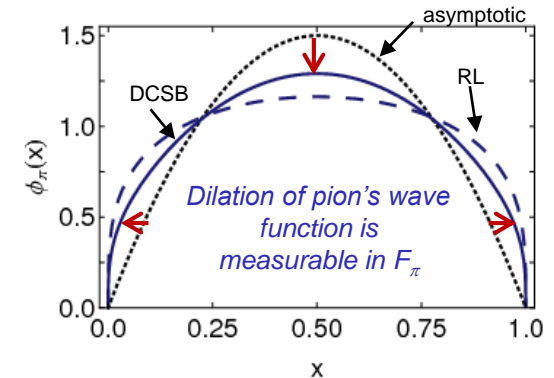

- The *pion* is the lightest QCD quark system and also has a central role in our understanding of the dynamic generation of mass - *kaon* is the next simplest system containing strangeness

Clearest test case for studies of the transition from non-perturbative to perturbative regions

❑ Recent advances and future prospects in experiments

- Dramatically improved precision in F_π measurements
- 12 GeV JLab: F_π and exclusive meson studies up to highest possible Q^2 and possible F_{K^+} extractions

❑ Form factor data drive renewed activity on theory side

- Distribution amplitudes – signatures of dynamical chiral symmetry breaking

12 GeV JLab data have the potential to reach the regime in which hard QCD's signatures will be quantitatively revealed

Experimental Determination of the π^+ Form Factor

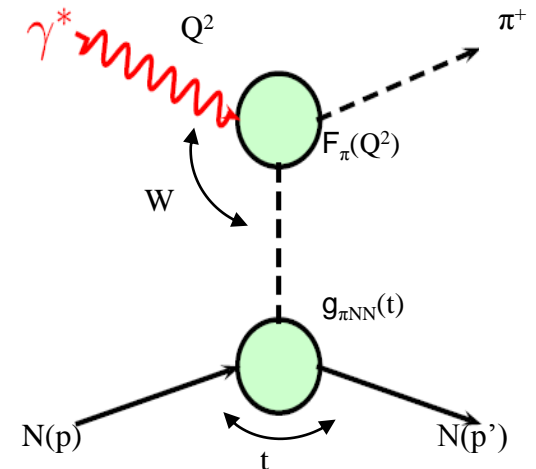

Through pion electroproduction

□ F_{π^+} measured indirectly using the “pion cloud” of the proton via the $p(e, e'\pi^+)n$ process

- At small $-t$, the pion pole process dominates the longitudinal cross section, σ_L
- In the Born term model, F_π^2 appears as

$$\frac{d\sigma_L}{dt} \propto \frac{-t}{(t - m_\pi^2)} g_{\pi NN}^2(t) Q^2 F_\pi^2(Q^2, t)$$

[In practice one uses a more sophisticated model]

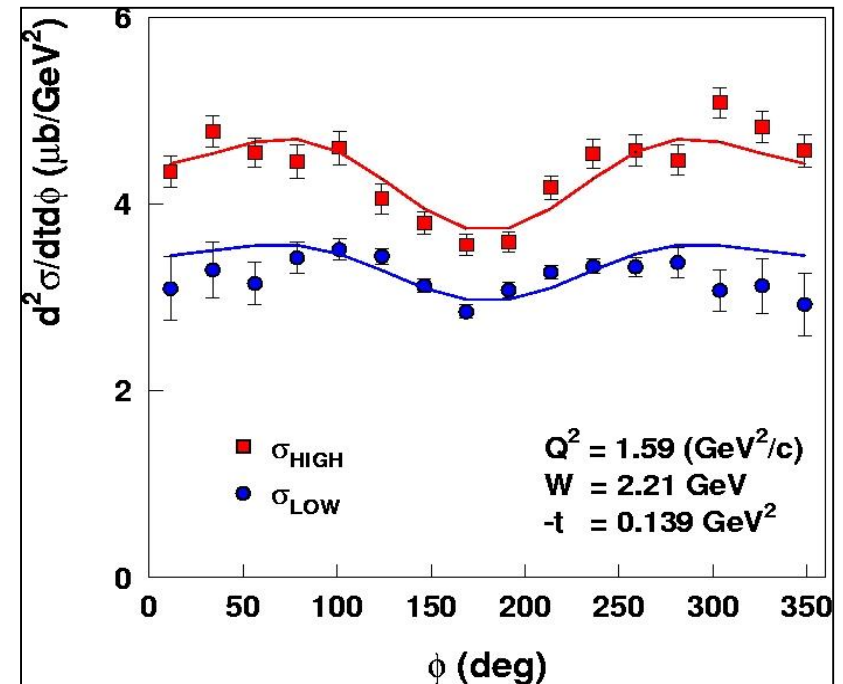

□ Requirements:

- Full L/T separation of the cross section – isolation of σ_L
- Selection of the pion pole process
- Extraction of the form factor using a model
- Validation of the technique - model dependent checks

L/T Separation Example

- ❑ σ_L is isolated using the Rosenbluth separation technique
 - Measure the cross section at two beam energies and fixed W , Q^2 , $-t$
 - Simultaneous fit using the measured azimuthal angle (ϕ_π) allows for extracting L , T , LT , and TT
- ❑ Careful evaluation of the systematic uncertainties is important due to the $1/\varepsilon$ amplification in the σ_L extraction
 - Spectrometer acceptance, kinematics, and efficiencies

$$2\pi \frac{d^2 \sigma}{dt d \phi} = \varepsilon \frac{d\sigma_L}{dt} + \frac{d\sigma_T}{dt} + \sqrt{2\varepsilon(\varepsilon+1)} \frac{d\sigma_{LT}}{dt} \cos \phi + \varepsilon \frac{d\sigma_{TT}}{dt} \cos 2\phi$$

σ_L will give us F_π

- ❑ Magnetic spectrometers a must for such precision cross section measurements
 - This is only possible in Hall C at JLab

Extraction of F_π from σ_L JLab data

- JLab 6 GeV F_π experiments used the VGL/Regge model as it has proven to give a reliable description of σ_L across a wide kinematic domain

[Vanderhaeghen, Guidal, Laget, PRC 57, (1998) 1454]

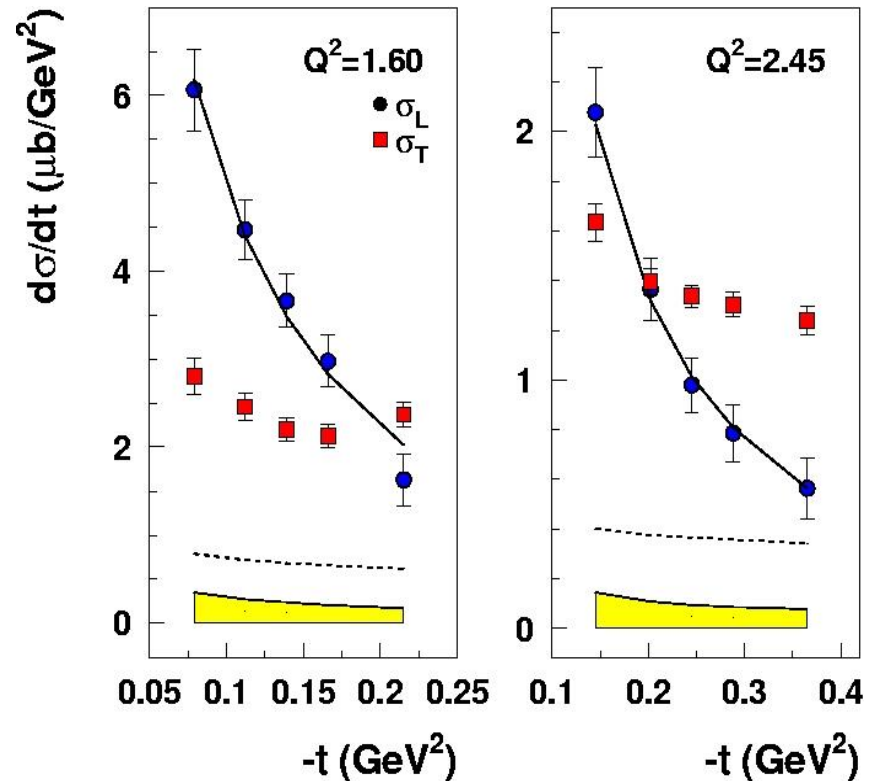

- Feynman propagator replaced by π and ρ trajectories
- Model parameters fixed by pion photoproduction data
- Free parameters: $\Lambda_\pi^2, \Lambda_\rho^2$

$$F_\pi(Q^2) = \frac{1}{1 + Q^2 / \Lambda_\pi^2}$$

Fit of σ_L to model gives F_π at each Q^2

[Horn et al., PRL 97, (2006) 192001]

$$\Lambda_\pi^2 = 0.513, 0.491 \text{ GeV}^2$$

$$\Lambda_\rho^2 = 1.7 \text{ GeV}^2$$

Validation: Experimental Considerations

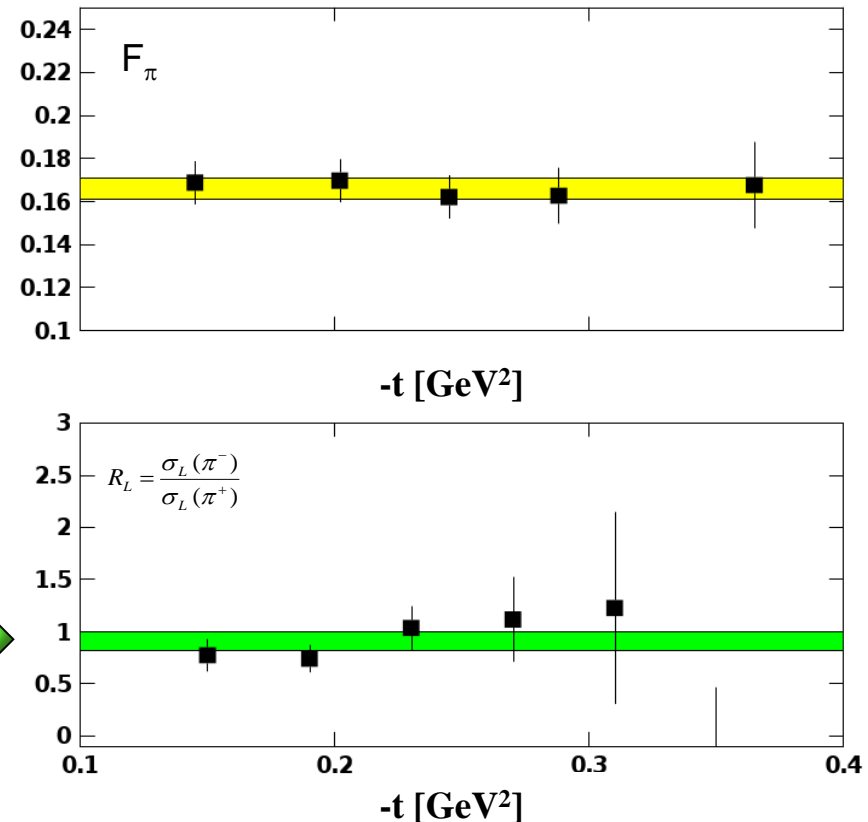

Experimental studies over the last decade have given confidence in the electroproduction method yielding the physical pion form factor

□ Experimental studies include:

- Check consistency of model with data
 - F_π values do not depend on the t -acceptance – confidence in applicability of model to the kinematic regime of the data
- Verify that the pion pole diagram is the dominant contribution in the reaction mechanism
 - R_L approaches the pion charge ratio, consistent with pion pole dominance

[Huber et al, PRL112 (2014)182501]

[T. Horn, C.D. Roberts, J. Phys. G43 (2016) no.7, 073001]

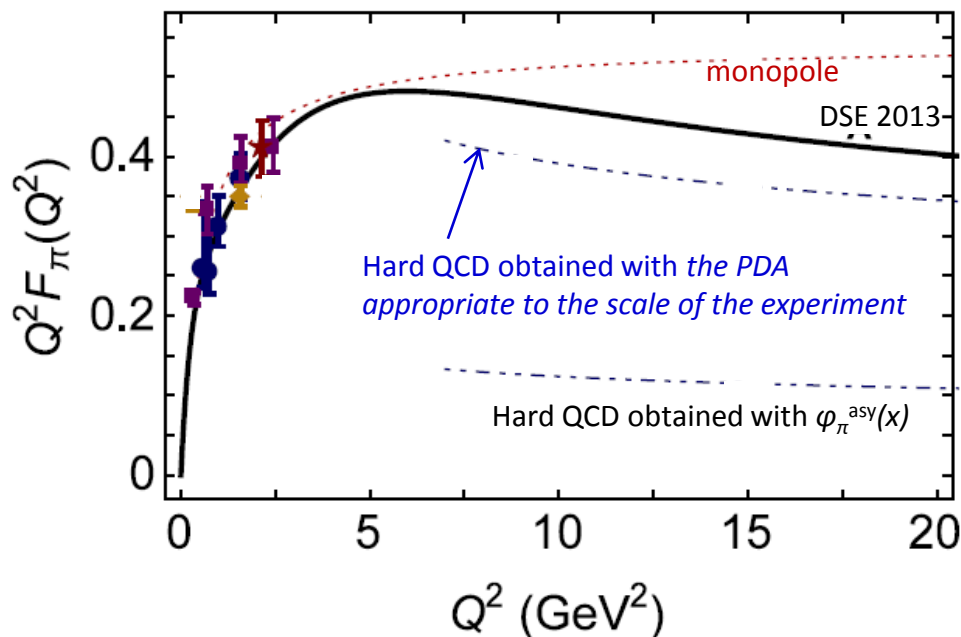

- Extract F_π at several values of t_{\min} for fixed Q^2

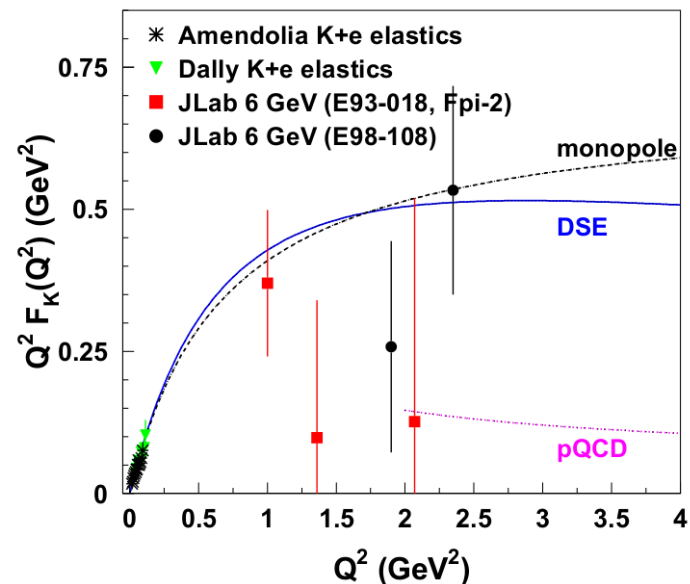

$$R_L = \frac{\sigma(n(e, e' \pi^-) p)}{\sigma(p(e, e' \pi^+) n)} = \frac{|A_v - A_s|^2}{|A_v + A_s|^2}$$

$F_{\pi^+}(Q^2)$ and $F_{K^+}(Q^2)$ in 2018

$F_{\pi^+}(Q^2)$

$F_{K^+}(Q^2)$

[M. Carmignotto et al., Phys. Rev. C97 (2018) no.2, 025204]

- ❑ Factor ~ 3 from hard QCD calculation evaluated with asymptotic valence-quark Distribution Amplitude (DA) [L. Chang, et al., PRL 111 (2013) 141802; PRL 110 (2013) 1322001]
 - Trend consistent with time like meson form factor data up to $Q^2=18$ GeV² [Seth et al, PRL 110 (2013) 022002]

- ❑ Recent developments: when comparing the hard QCD prediction with a pion valence-quark DA of a form appropriate to the scale accessible in experiments, magnitude is in better agreement with the data

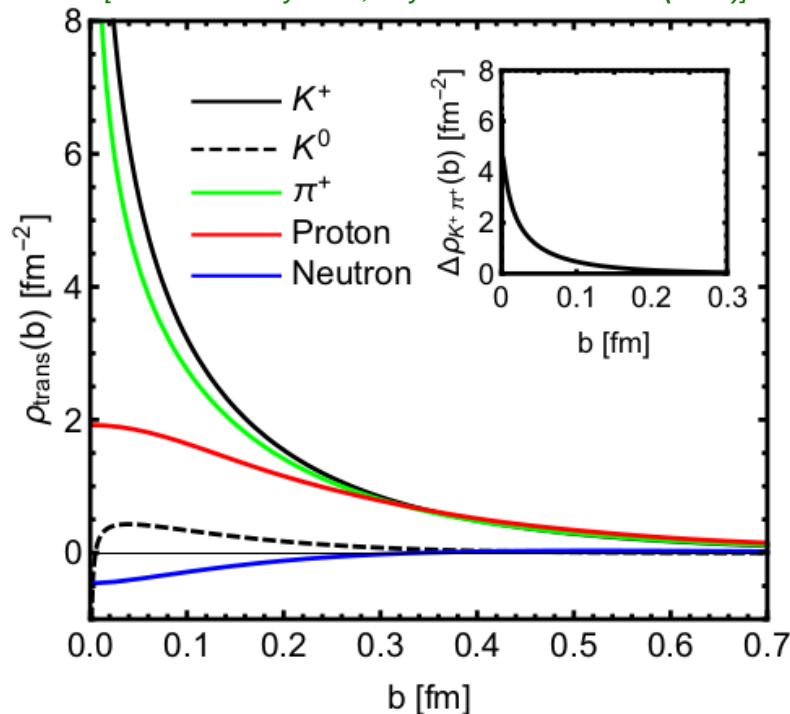

[I. Cloet, et al., PRL 111 (2013) 092001]

Pion and Kaon transverse Charge Density

- Transverse charge densities allow interpretation of FFs in terms of physical charge density and are also related to the Generalized Parton Distributions

[M. Carmignotto et al., Phys. Rev. C **90** 025211 (2014)]

[N.A. Mecholsky et al., Phys. Rev. C **96** 065207 (2017)]

$$\rho_{\pi}(b) = \frac{1}{\pi R^2} \sum_{n=1}^{\infty} F_{\pi}(Q_n^2) \frac{J_0(X_n \frac{b}{R})}{[J_1(X_n)]^2} \quad Q_n \equiv \frac{X_n}{R}$$

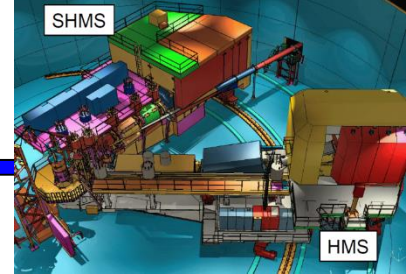

- Uncertainty in the analysis dominated by incompleteness error

➤ Estimated using the monopole as upper bound and a light front model as lower bound

□ ρ_{π} and ρ_p coalesce for $0.3 \text{ fm} < b < 0.6 \text{ fm}$; and so does ρ_{K^+}

□ It would be interesting to extract the transverse charge density for different flavors

JLab12: $F_{\pi^+}(Q^2)$ measurements

- CEBAF 10.9 GeV electron beam and SHMS small angle capability and controlled systematics are essential for extending precision measurements to higher Q^2

The JLab 12 GeV π^+ experiments:

- E12-06-101:** determine F_{π} up to $Q^2=6$ GeV^2 in a dedicated experiment

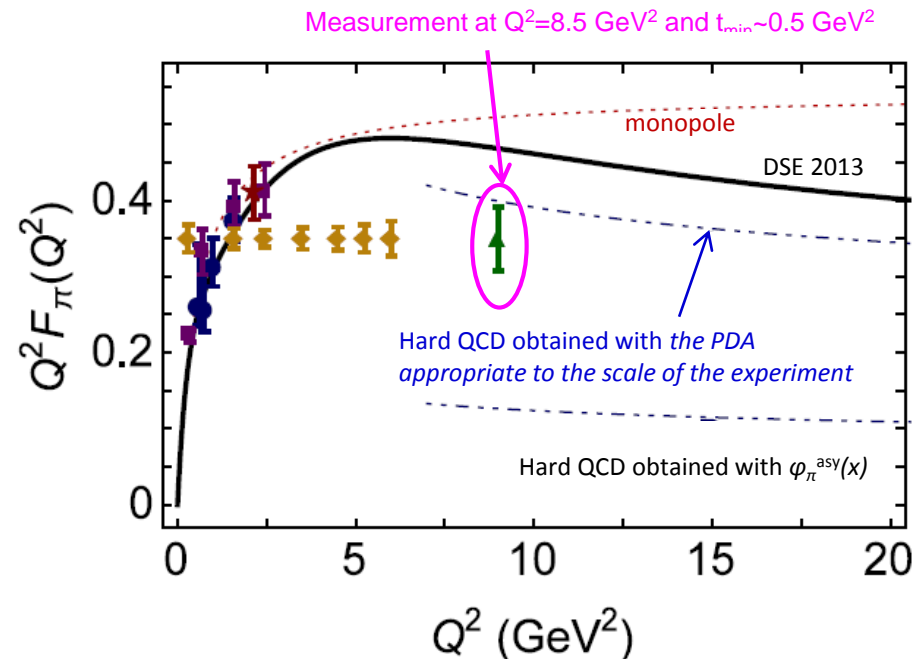

- Approved for 52 PAC days with “A” rating, high impact

E12-06-101 spokespersons: G. Huber, D. Gaskell

- E12-07-105:** probe conditions for factorization of deep exclusive measurements in π^+ data to highest possible $Q^2 \sim 9 \text{ GeV}^2$ with SHMS/HMS

- Potential to extract F_{π} to the highest $Q^2 \sim 9 \text{ GeV}^2$ achievable at JLab 12 GeV
- Approved for 40 PAC days with “A-” rating

E12-07-105 spokespersons: T. Horn, G. Huber

JLab12: Opportunities for $F_{K^+}(Q^2)$ Measurements

□ Possible K^+ form factor extraction to highest possible Q^2 achievable at JLab

- Extraction like in the pion case by studying the model dependence at small t
- Comparative extractions of F_π at small and larger t show only modest model dependence
 - larger t data lie at a similar distance from pole as kaon data

□ Recent theoretical efforts to understand role of the strange quark

[F. Gao et al., Phys. Rev. D 96 (2017) no. 3, 034024]

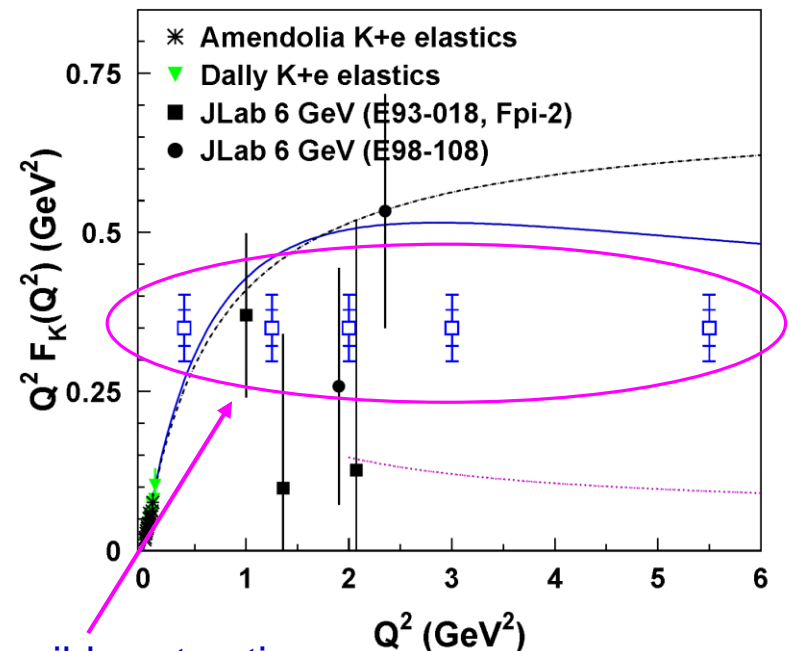

[P.T.P. Hutauruk et al., Phys. Rev. C 94 (2016) 035201]

[C. Chen et al., Phys. Rev. D 93 (2016) no. 7, 074021]

[S-S Xu et al., arXiv:1802.09552 (2018)]

[T. Horn, C.D. Roberts, J. Phys. G43 (2016) no.7, 073001]

[M. Carmignotto et al., Phys. Rev. C97 (2018) no.2, 025204]

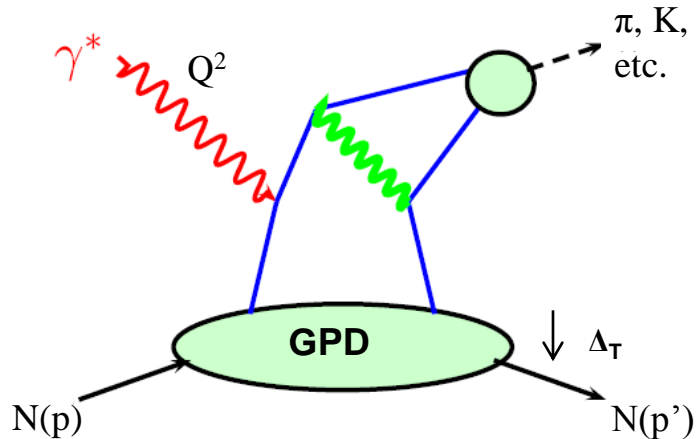

Exploring the 3D Nucleon Structure

- After decades of study of the partonic structure of the nucleon we finally have the experimental and theoretical tools to systematically move beyond a 1D momentum fraction (x_{Bj}) picture of the nucleon.
 - High luminosity, large acceptance experiments with polarized beams and targets.
 - Theoretical description of the nucleon in terms of a 5D Wigner distribution that can be used to encode both 3D momentum and transverse spatial distributions.
- • Deep Exclusive Scattering (DES) cross sections give sensitivity to electron-quark scattering off quarks with longitudinal momentum fraction (Bjorken) x at a transverse location b . ←
- Semi-Inclusive Deep Inelastic Scattering (SIDIS) cross sections depend on transverse momentum of hadron, $P_{h\perp}$, but this arises from both intrinsic transverse momentum (k_T) of a parton and transverse momentum (p_T) created during the [parton \rightarrow hadron] fragmentation process.

Towards GPD spin-flavor separation: DVMP

- Relative contribution of σ_L and σ_T to cross section are of great interest for nucleon structure studies

- described by 4 (helicity non-flip) GPDs:
 - H, E (unpolarized), \tilde{H}, \tilde{E} (polarized)
- Quantum numbers in DVMP probe individual GPD components selectively
 - Vector : $\rho^0/\rho+/K^*$ select H, E
 - **Pseudoscalar: π, η, K select the polarized GPDs, \tilde{H} and \tilde{E}**
- Reaction mechanism can be verified experimentally - **L/T separated cross sections to test QCD Factorization**

- Recent calculations suggest that leading-twist behavior for light mesons may be reached at $Q^2=5-10 \text{ GeV}^2$
- JLab 12 GeV can provide experimental confirmation in the few GeV regime

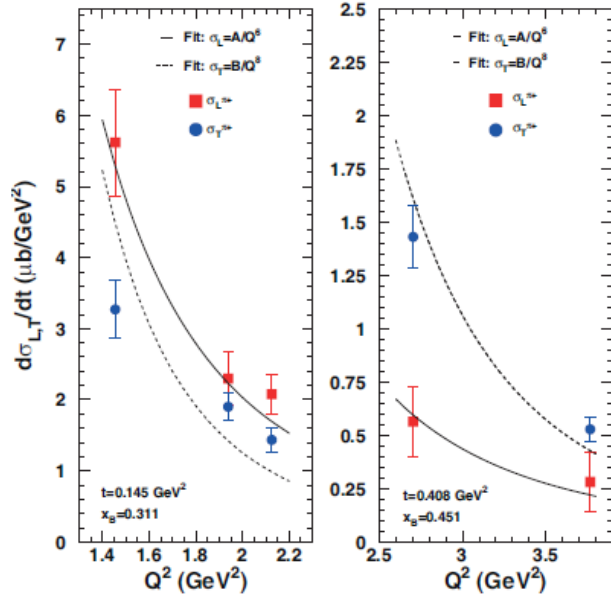

Results from 6 GeV JLab

- Data demonstrate the technique of measuring the Q^2 dependence of L/T separated cross sections at fixed x/t to test QCD Factorization

- Consistent with expected factorization, but small lever arm and relatively large uncertainties
- GPD models cannot reproduce ρ^0 data at small W

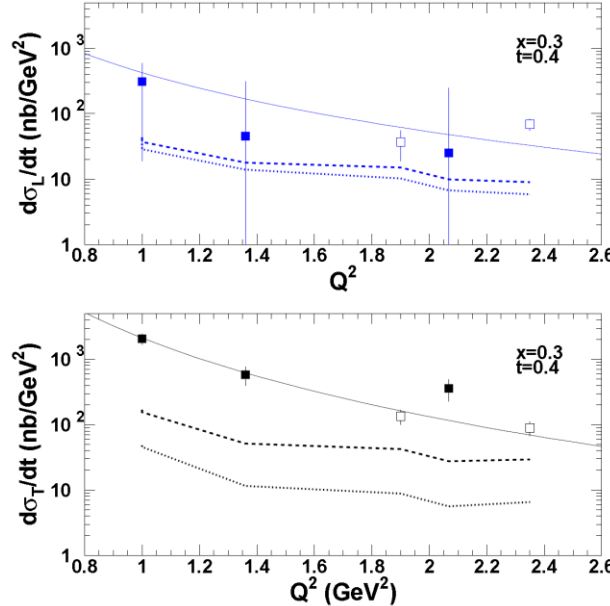

π^+

[T. Horn et al., Phys. Rev. C **78**, 058201 (2008)]

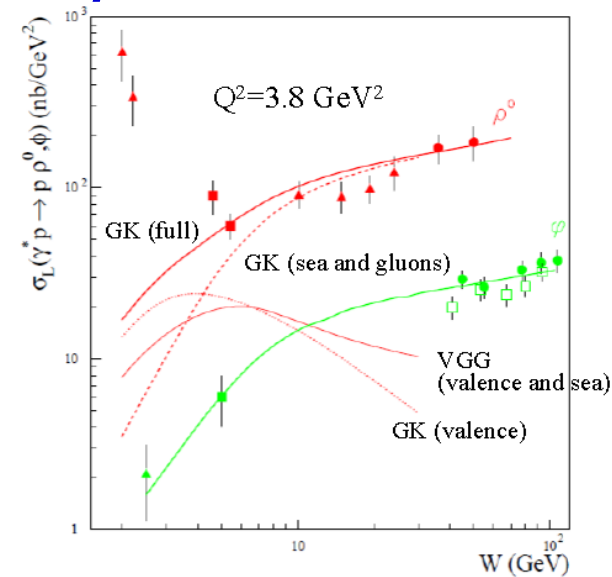

K^+

[M. Carmignotto et al., Phys. Rev. C **97** (2018) no.2, 025204]

ρ^0

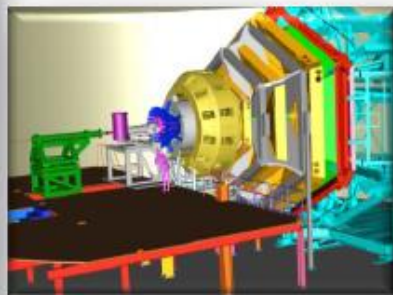

[L. Favart, M. Guidal, T. Horn, P. Kroll, Eur. Phys. J A **52** (2016) no.6, 158]

- Separated cross sections over a large range in Q^2 are essential for:

- Testing factorization and understanding dynamical effects in both Q^2 and $-t$ kinematics
- Interpretation of non-perturbative contributions in experimentally accessible kinematics

12 GeV (GPD/TMD) Scientific Capabilities

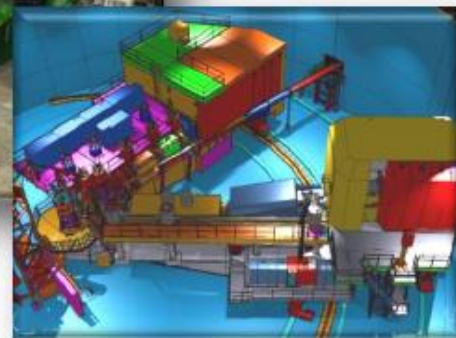

Hall B – understanding **nucleon structure** via generalized parton distributions

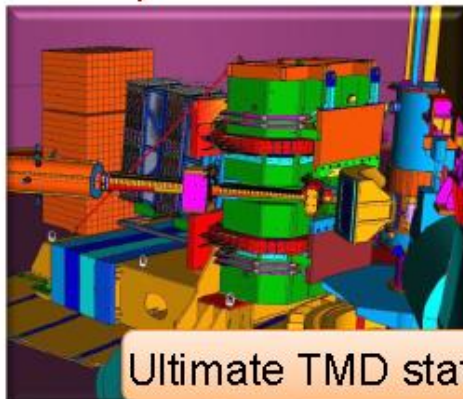

TMDs and GPDs comprehensive study

Hall C – precision determination of **valence quark** properties in nucleons/nuclei

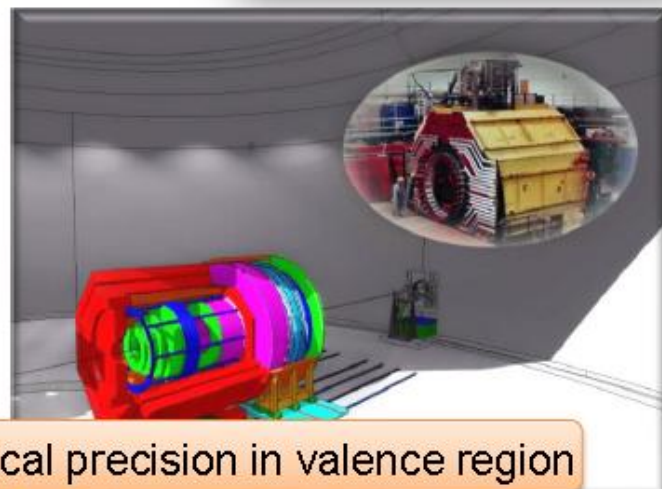

SIDIS/DES cross-section factorization tests

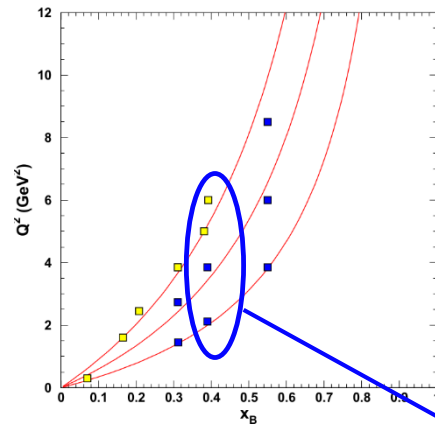

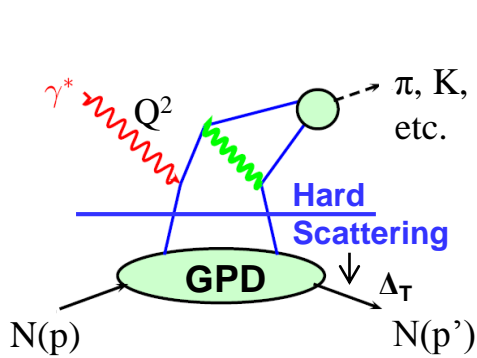

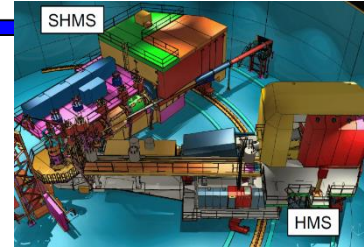

Hall A – polarized ^3He , future new experiments (e.g., SBS, MOLLER and SoLID)

Ultimate TMD statistical precision in valence region

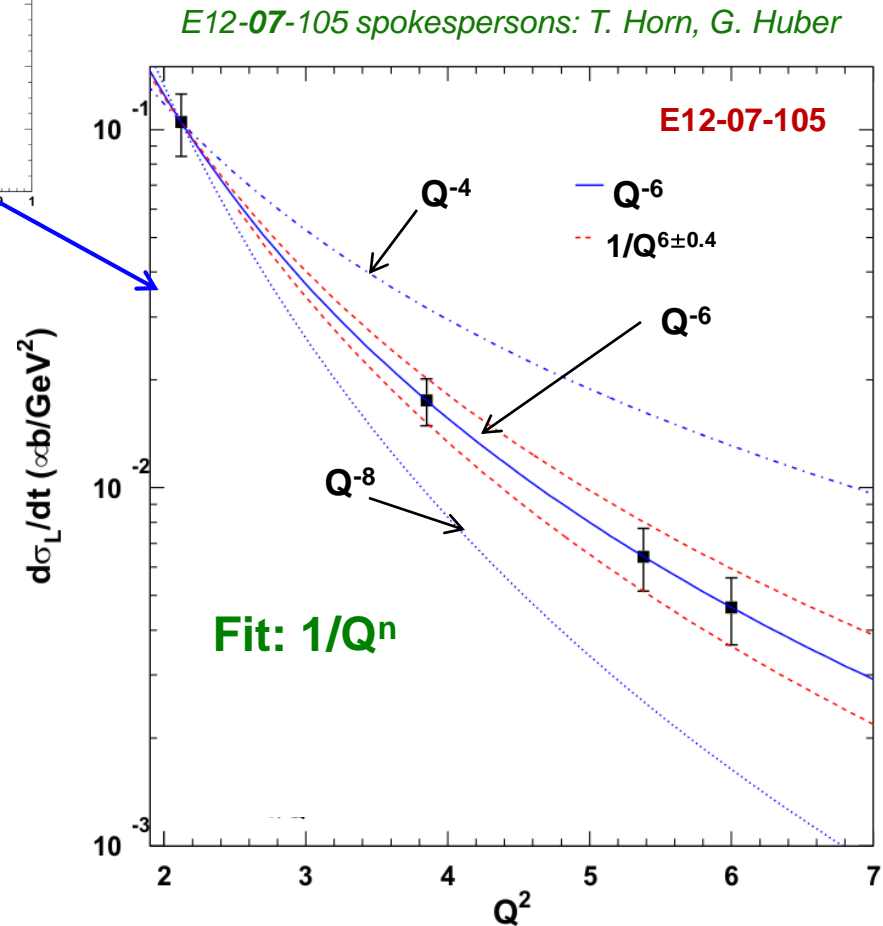

JLab12: confirming potential for nucleon structure studies with pion production

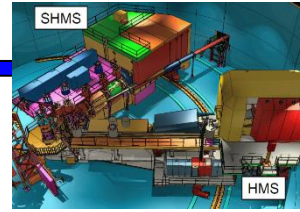

- **E12-07-105 (P12):** Measure the Q^2 dependence of the π electro production cross section at fixed x and $-t$
- Factorisation theorem predicts σ_L scales to leading order as Q^{-6}

x	Q^2 (GeV ²)	W (GeV)	$-t$ (GeV/c) ²
0.3	1.5-2.7	2.0-2.6	0.1
0.4	2.1-6.0	2.0-3.2	0.2
0.5	3.9-8.5	2.0-2.8	0.5

JLab12: confirming potential for nucleon structure studies with kaon production

- ❑ **E12-09-011:** Separated L/T/LT/TT cross section over a wide range of Q^2 and t

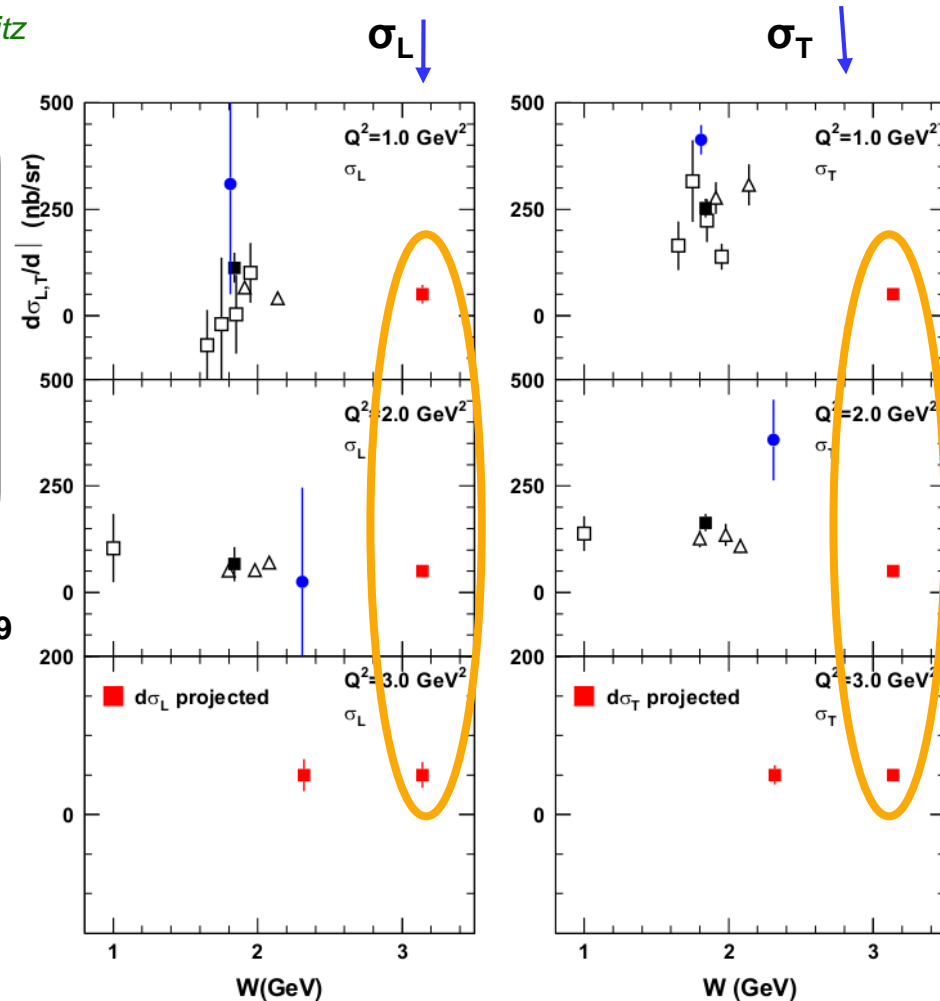

E12-09-011 spokespersons: T. Horn, G. Huber, P. Markowitz

JLab 12 GeV Kaon Program features:

- First cross section data for Q^2 scaling tests with kaons
- Highest Q^2 for L/T separated kaon electroproduction cross section
- First separated kaon cross section measurement above $W=2.2$ GeV

approved for 40 PAC days and **scheduled to run in 2018/19**

x	Q^2 (GeV ²)	W (GeV)	-t (GeV/c) ²
0.1-0.2	0.4-3.0	2.5-3.1	0.06-0.2
0.25	1.7-3.5	2.5-3.4	0.2
0.40	3.0-5.5	2.3-3.0	0.5

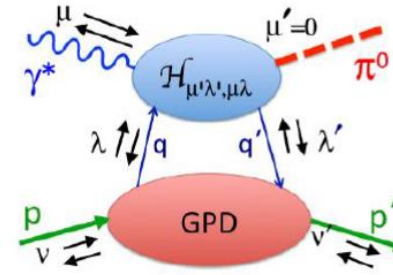

[blue points from M. Carmignotto, PhD thesis (2017)]

Transverse Contributions may allow for probing a new set of GPDs

- 4 Chiral-odd GPDs (parton helicity flip)

- A large transverse cross section in meson production may allow for accessing helicity flip GPDs

$$\tilde{H}^\pi = \frac{1}{3\sqrt{2}} [2\tilde{H}^u + \tilde{H}^d]$$

$$\sigma_T = \frac{4\pi\alpha_e \mu_\pi^2}{2\kappa Q^4} \left[(1 - \xi^2) |\langle HT \rangle|^2 - \frac{t'}{8m^2} |\langle \overline{E}_T \rangle|^2 \right]$$

- Model predictions based on handbag in good agreement with 6 GeV data

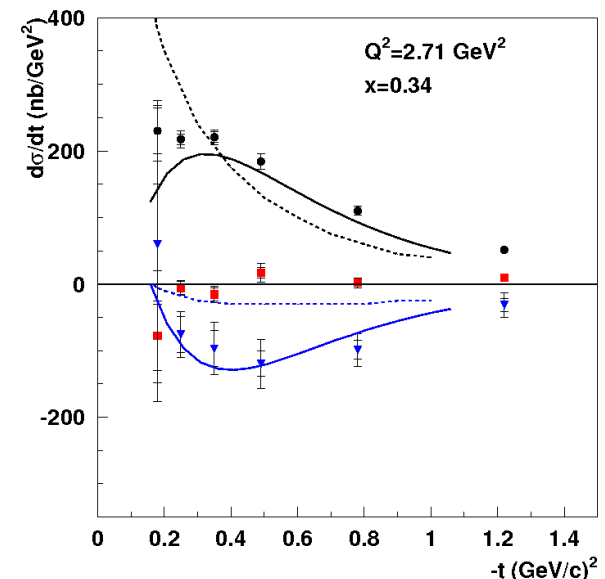

[Goloskokov, Kroll, EPJ C65, 137 (2010); EPJ A45, 112 (2011)]

[Goldstein, Gonzalez Hernandez, Liuti, J. Phys. G 39 (2012) 115001]

[Ahmad, Goldstein, Liuti, PRD 79 (2009)]

- JLab 12 GeV will provide relative σ_L and σ_T contributions to the π^0 cross section up $Q^2 \sim 6 \text{ GeV}^2$ to verify reaction mechanism

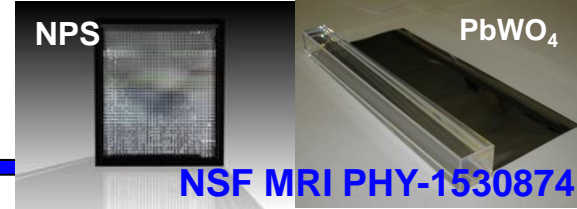

- Exclusive π^0 data may also be helpful for constraining non-pole contributions in F_π extraction

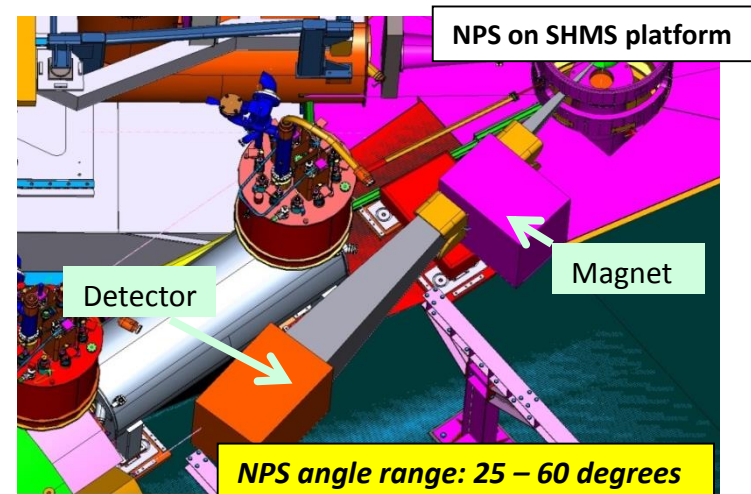

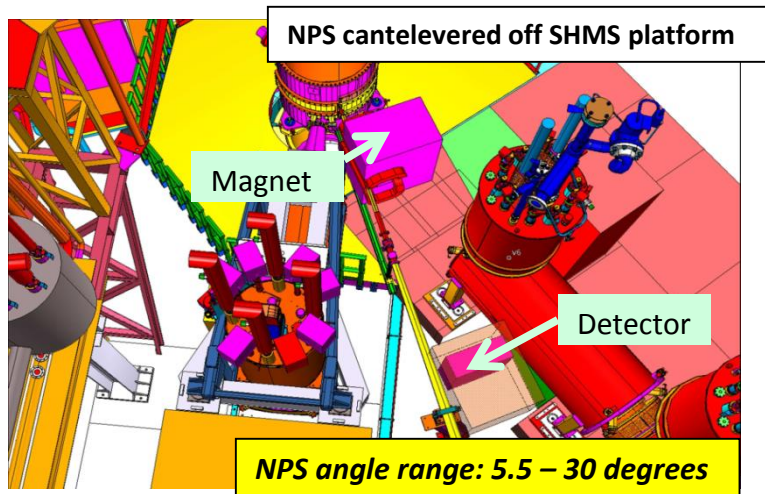

[Favart, Guidal, Horn, Kroll, EPJA (2016)]

[Bedlinskiy et al. PRL 109 (2012) 112001]

New Opportunities with the Neutral Particle Spectrometer (NPS)

- ❑ The NPS is envisioned as a facility in Hall C, utilizing the well-understood HMS and the SHMS infrastructure, to allow for precision (coincidence) cross section measurements of neutral particles (γ and π^0).

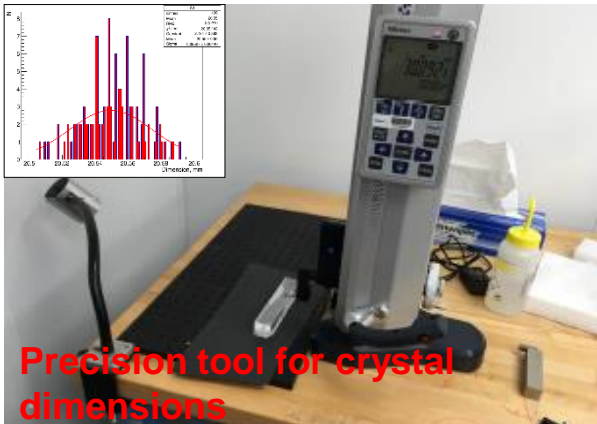

- ❑ Approved experiments to date
 - E12-13-010 – Exclusive Deeply Virtual Compton and π^0 Cross Section Measurements in Hall C
 - E12-13-007: Measurement of Semi-inclusive π^0 production as Validation of Factorization
 - E12-14-003 – Wide-angle Compton Scattering at 8 and 10 GeV Photon Energies
 - E12-14-005 – Wide Angle Exclusive Photoproduction of π^0 Mesons
 - E12-17-008 – Polarization Observables in Wide-Angle Compton Scattering (cond. approved)
- ❑ Ideas exist for future experiments (e.g., TCS with transverse target)

NPS Project Status

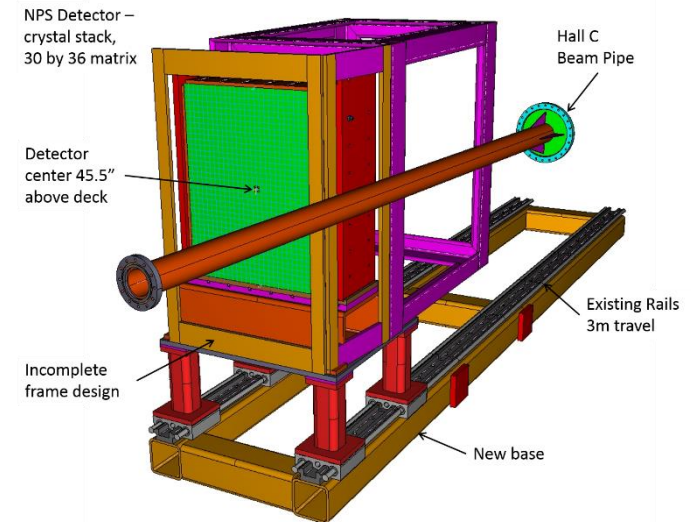

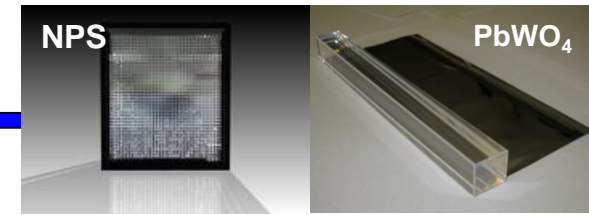

Four fully approved experiments, supported by NSF MRI PHY-1530874 (CUA, OU, ODU), international (IPN-Orsay, Glasgow, Yerevan), and JLab

- ❑ **PMT and HV bases:** design drawings final, prototyping, procurement started, first articles received
- ❑ **Frame and integrated systems:** concepts and initial design complete, detailed drawings to be presented later this year, prototype tests ongoing

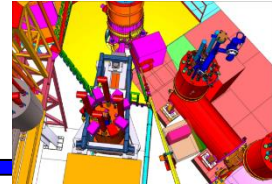

- ❑ **Magnet:** corrector and main coil construction complete, corrector coil is in test lab, yoke steel cutting nearly final, setting up space in test lab for assembly

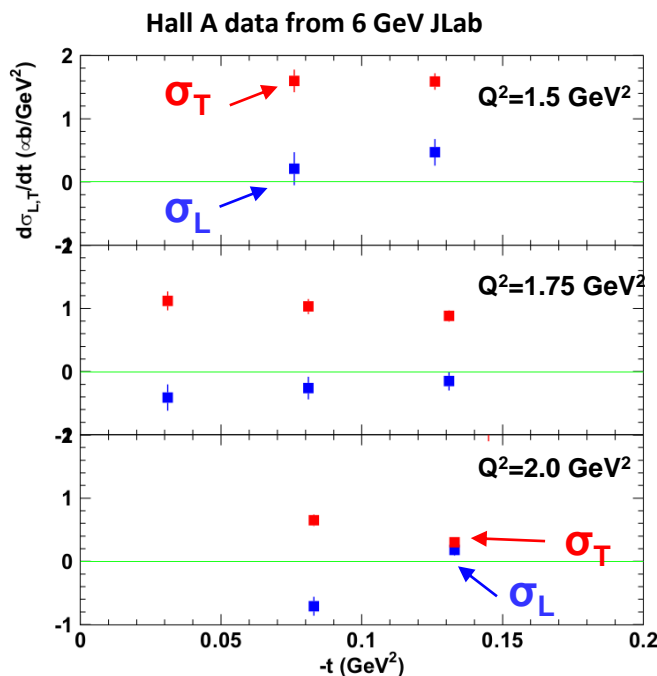

- ❑ **Crystals:** 460 crystals procured from SICCAS, plan to procure few 100 from Crytur, full crystal testing facilities at CUA and IPN-Orsay, chemical analysis and crystal growth in collaboration with the Vitreous State Laboratory (VSL), synergy with EIC crystal calorimeter R&D

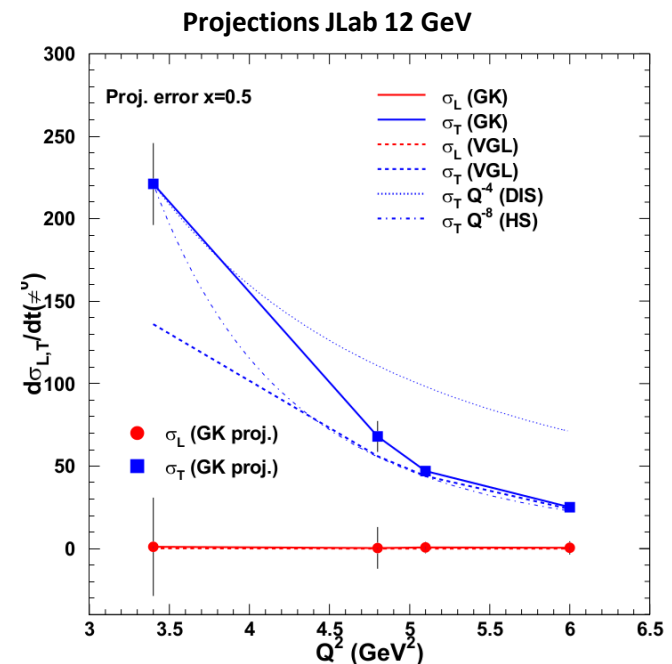

E12-13-010: Exclusive π^0 cross section

- ❑ Relative L/T contribution to π^0 cross section important in probing transversity
 - If σ_T large: access to transversity GPDs
- ❑ Results from Hall A suggest that σ_L in π^0 production is non-zero up to $Q^2=2 \text{ GeV}^2$
- ❑ Need to understand Q^2/t dependence for final conclusion on dominance of σ_T

**E12-13-010
projections**

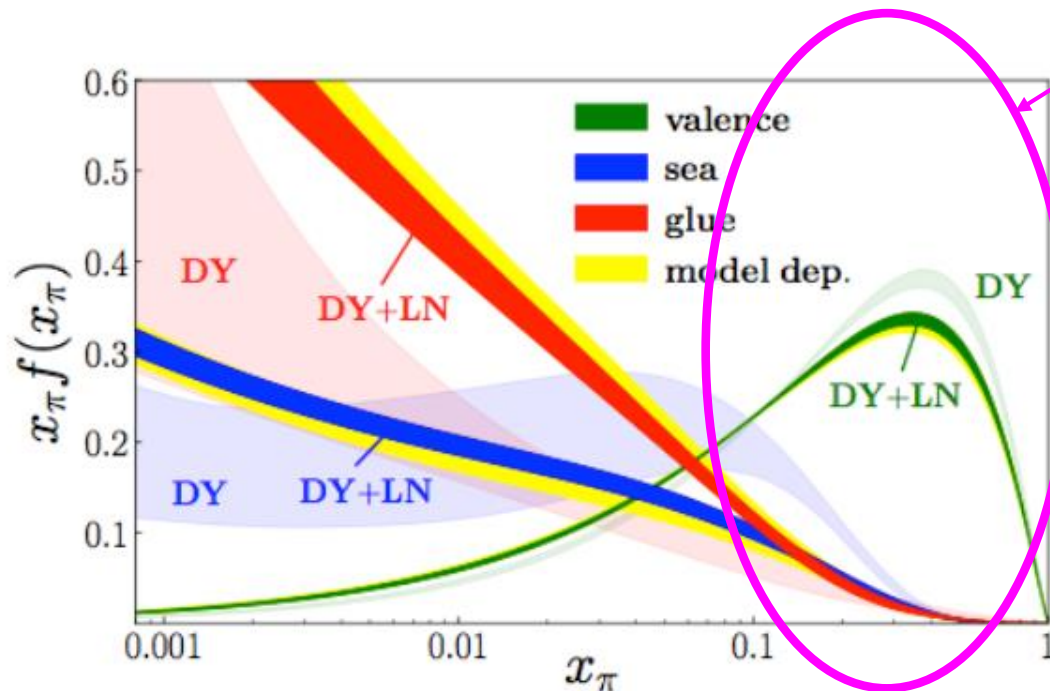

M. Defurne et al, PRL **117** (2016) no.26, 262001

E12-13-010 will provide essential data on σ_T and σ_L at higher Q^2 for reliable interpretation of 12 GeV GPD data

Meson Structure Functions

❑ First MC global QCD analysis of pion PDFs

- Using Fermilab DY and HERA Leading Neutron data

- ❑ JLab 12 GeV: Tagged Pion and Kaon TDIS
- ❑ Also prospects for kaon DY at COMPASS and pion and kaon LN at EIC

DY = πN Drell-Yan

LN = Leading Neutron

*Barry, Sato, Melnitchouk, Ji
(2018, to appear)*

- Significant reduction of uncertainties on sea quark and gluon distributions in the pion with inclusion of HERA leading neutron data
- Implications for “TDIS” (Tagged DIS) experiments at JLab

Summary and Outlook

- ❑ Meson form factors and structure functions play an important role in our understanding of hadrons
- ❑ JLab 12 GeV will dramatically improve the light meson data set
 - Pion and kaon form factor extractions up to high Q^2 possible (~ 9 and ~ 6 GeV^2)
 - L/T separated cross sections to validate applicability of hard-soft factorization – may allow for accessing new type of GPDs
 - The Neutral Particle Spectrometer gives unique opportunity for coincidence precision cross section measurements with neutral particles
 - Pion and kaon large- x structure functions through Tagged DIS – beyond 12 GeV, also prospects for kaon DY at COMPASS and pion and kaon structure function measurements at EIC

HMS + SHMS: P_T coverage

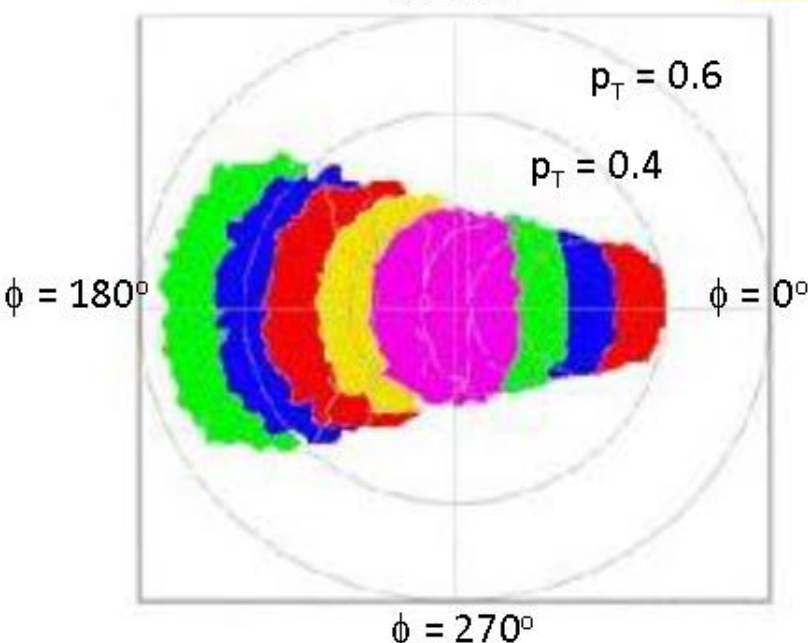

E12-09-017

Can do meaningful $\pi^{+/-}$ measurements at low p_T (down to 0.05 GeV) due to excellent momentum and angle resolutions!

- **Excellent** ϕ coverage
up to $P_T = 0.2$ GeV
- **Sufficient** up to $P_T = 0.4$ GeV
→ coverage at $\phi = 0, \pi$
- Limited up to $P_T = 0.5$ GeV
→ use $f(\phi)$ from CLAS12

$\phi = 90^\circ$

$\pi^{+/-}$

HMS + NPS: P_T coverage

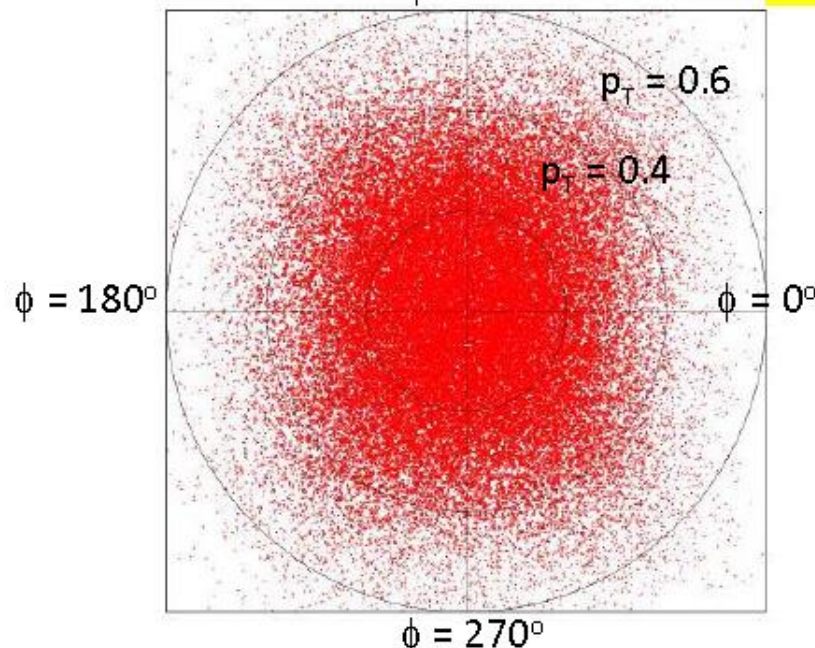

E12-13-007

Basic π^0 SIDIS cross sections with excellent precision, and very good momentum and angle resolutions!

- **Excellent** ϕ coverage
up to $P_T = 0.3$ GeV
- **Good** up to $P_T = 0.4$ GeV
- Limited up to $P_T = 0.5$ GeV
→ use $f(\phi)$ from CLAS12

$\phi = 90^\circ$

π^0

Hall C SIDIS Program (typ. $x/Q^2 \sim \text{constant}$)

HMS + SHMS (or NPS) Accessible Phase Space for SIDIS; w. typical z range 0.3-0.65

*Accurate cross sections
for validation of SIDIS
factorization framework
and for L/T separations*
