scattering experiments

$$\frac{d\sigma}{dQ^2} = \frac{\pi\alpha^2}{Q^4 m_p^2 \vec{p}_\mu^2} \left[\left(G_E^2 + \tau G_M^2 \right) \frac{4E_\mu^2 m_p^2 - Q^2 (s - m_\mu^2)}{1 + \tau} - G_M^2 \frac{2m_\mu^2 Q^2 - Q^4}{2} \right]$$

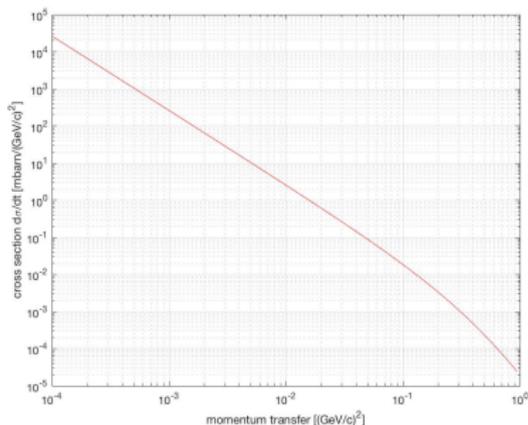

$$\text{with } \tau = Q^2 / (4m_p^2)$$

mean squared charge-radius

$$\langle r_E^2 \rangle = -6\hbar^2 \left. \frac{dG_E(Q^2)}{dQ^2} \right|_{Q^2 \rightarrow 0}$$

$$G_E(Q^2) \approx G_M(Q^2) / \mu_p \approx$$

$$G_D(Q^2) = (1 + Q^2/a^2)^{-2}$$

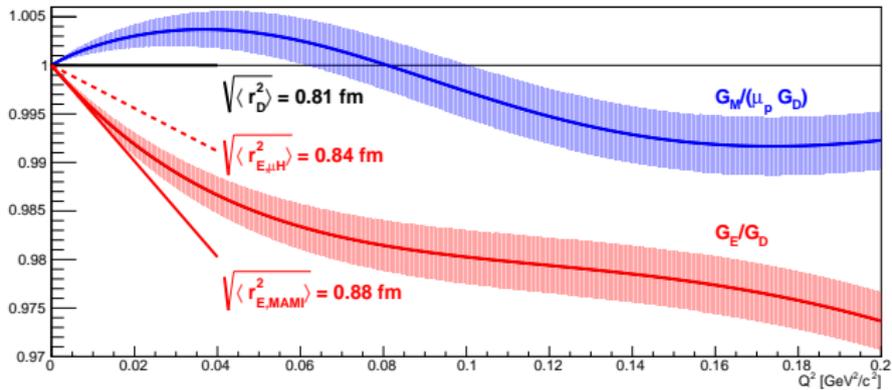

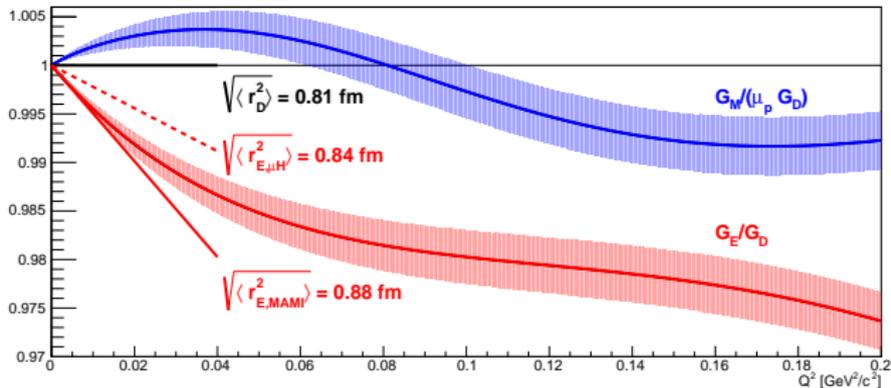

$$\frac{d\sigma}{dQ^2} = \frac{\pi\alpha^2}{Q^4 m_p^2 \vec{p}_\mu^2} \left[\left(G_E^2 + \tau G_M^2 \right) \frac{4E_\mu^2 m_p^2 - Q^2(s - m_\mu^2)}{1 + \tau} - G_M^2 \frac{2m_\mu^2 Q^2 - Q^4}{2} \right]$$

$$\text{with } \tau = Q^2 / (4m_p^2)$$

mean squared charge-radius

$$\langle r_E^2 \rangle = -6\hbar^2 \left. \frac{dG_E(Q^2)}{dQ^2} \right|_{Q^2 \rightarrow 0}$$

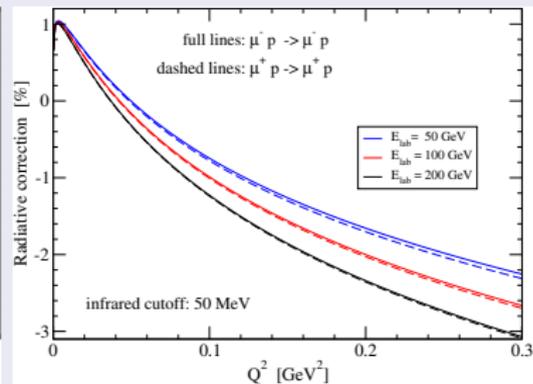

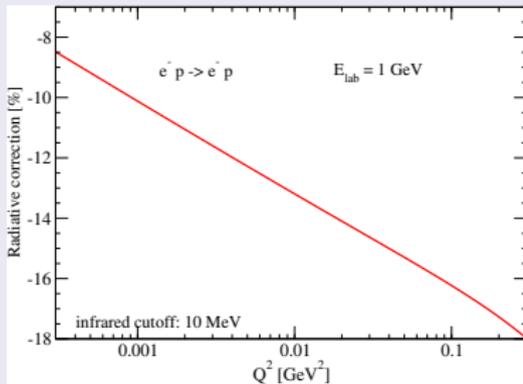

opportunity for new generation experiment at M2 beam line

- scatter muon beam off proton target
- measure cross-section dependence on Q^2
- obtain combination of electric and magnetic form factor $G_E^2 + \tau G_M^2$
 - form factors cannot be separated due to high beam energy

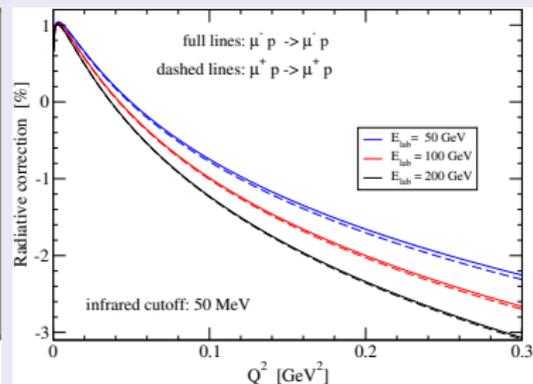

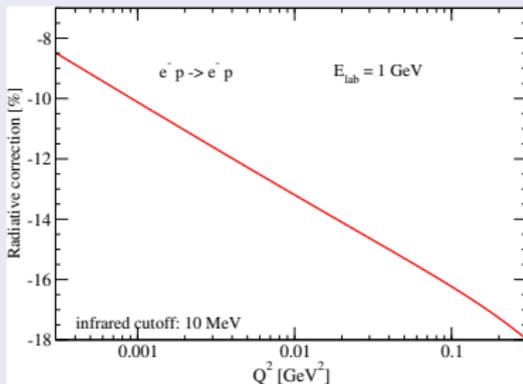

advantage of μ beam

$$d\sigma = d\sigma_{1\gamma} (1 + \delta)$$

- compared to e^- beam: smaller radiative corrections for μ beam

advantage of μ beam

$$d\sigma = d\sigma_{1\gamma} (1 + \delta)$$

- compared to e^- beam: smaller radiative corrections for μ beam
- measuring recoil proton will integrate over radiative tails
- uncertainty on remaining corrections
- will not reduce impact on overall cross-section measurement

advantage of high-energy μ beam

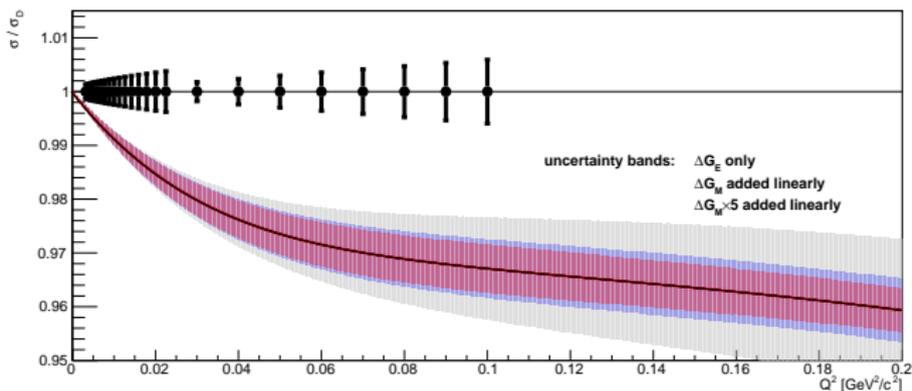

Coulomb corrections

- required corrections depend on scattering angle

$$\delta = Z\alpha\pi \frac{\sin \frac{\theta}{2} - \sin^2 \frac{\theta}{2}}{\cos^2 \frac{\theta}{2}}$$

- smaller scattering angle at higher energies

compared to μ beam at low energies: smaller corrections

requirements for measurement

assuming one year of data taking

- goal: uncertainty on $\sqrt{\langle r_E^2 \rangle} \approx 0.01$ fm
- systematics: $Q^2 \gtrsim 1 \cdot 10^{-3} (\text{GeV}/c)^2$
- uncertainty on G_M : $Q^2 \lesssim 0.2 (\text{GeV}/c)^2$

experimental challenges

identify elastic reactions

- measurement of recoil proton
- measurement of scattering angle of muon

measurement of recoil proton

- high-pressure hydrogen target
- wide range of recoil energies $\mathcal{O}(100 \text{ keV})$ to $\mathcal{O}(100 \text{ MeV})$
- required energy resolution $\mathcal{O}(50 \text{ keV})$

measurement of scattering angle of muon

position detectors

- small scattering angles $\mathcal{O}(100 \mu\text{rad})$
 - excellent spatial resolution required
- high intensity
 - fast detectors

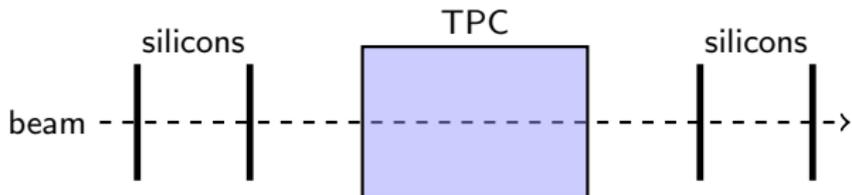

measurement of scattering angle of muon

position detectors

- small scattering angles $\mathcal{O}(100 \mu\text{rad})$
 - excellent spatial resolution required
- high intensity
 - fast detectors

silicon tracking detectors

- strip
 - for current silicon detectors required performance has been shown
- pixel

proposed set-up

- hydrogen TPC acting as active target
 - measurement of energy of recoil proton
 - between 0.5 and 100 MeV
 - required resolution: $\Delta \approx 60 \text{ keV}$
- silicon telescopes up- and downstream of target
 - measurement of muon scattering angles
 - $300 \mu\text{rad}$ at $Q^2 \approx 10^{-3} (\text{GeV}/c)^2$
 - required resolution $\sigma \lesssim 100 \mu\text{rad}$

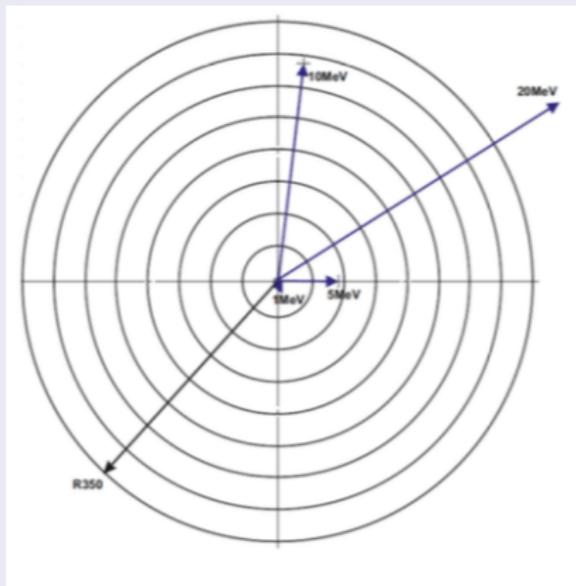

- in simulation: required resolution achieved down to small Q^2

combination of TPC and silicon detectors

- in simulation: required resolution achieved down to small Q^2
- test beam this year

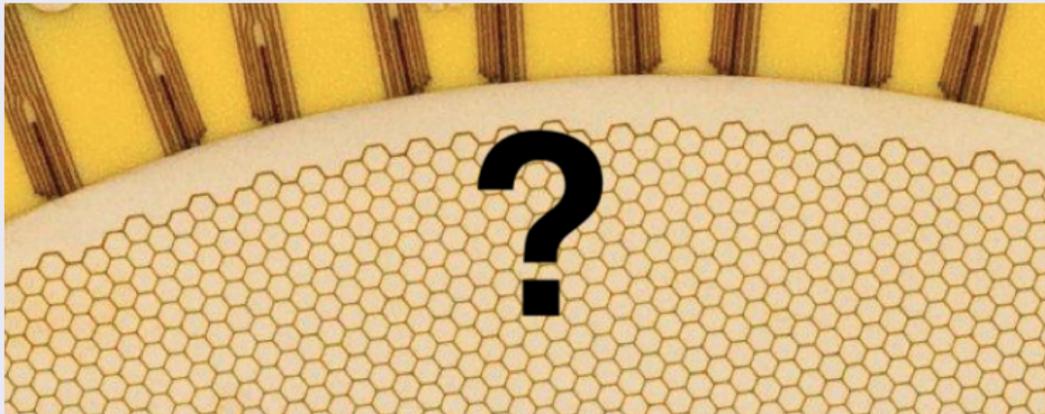

test beam set-up

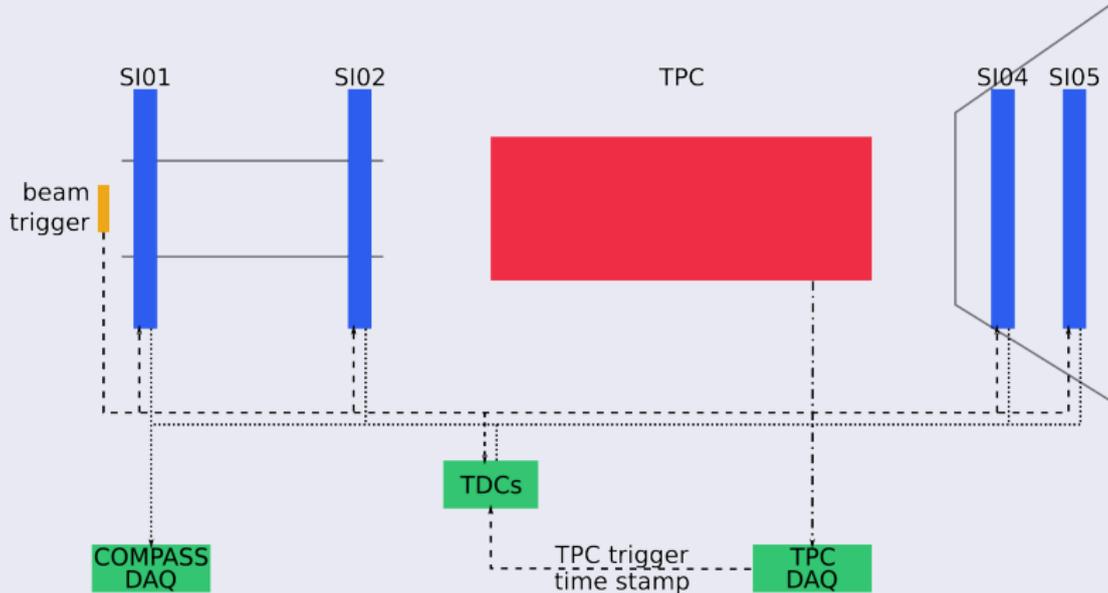

- performance of TPC in muon beam

test beam set-up

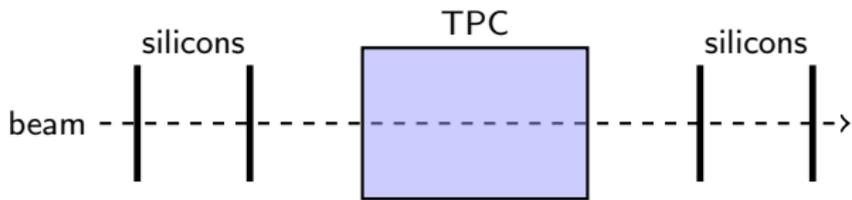

- performance of TPC in muon beam

test beam set-up

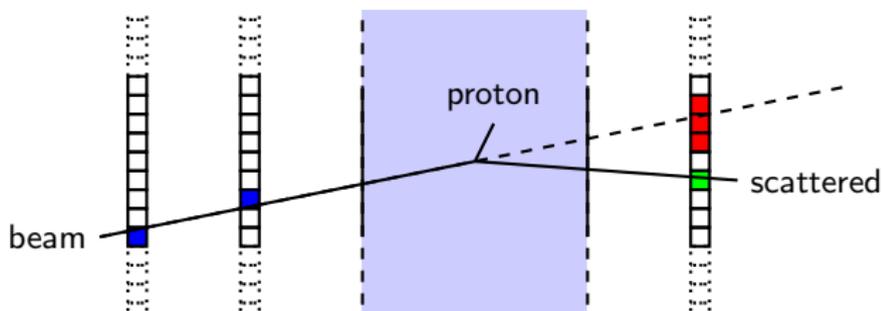

- performance of TPC in muon beam
- correlate events in silicon detectors with events in TPC

proposed set-up

- trigger on recoil proton signal
 - drift time in TPC $\mathcal{O}(100 \mu\text{s})$
 - trigger-less readout of all detectors
 - online event reconstruction to correlate proton and muon signals

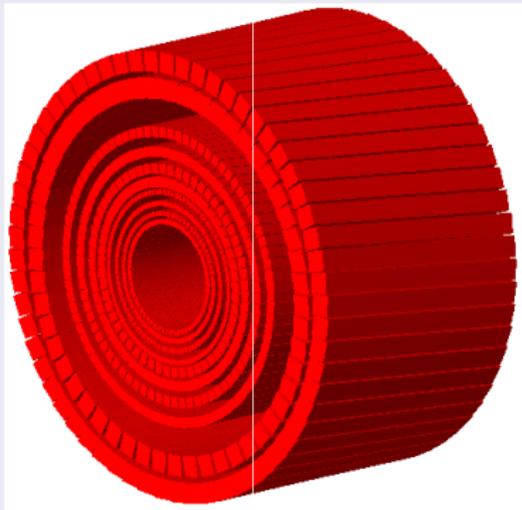

proposed set-up

- trigger on recoil proton signal
 - drift time in TPC $\mathcal{O}(100 \mu\text{s})$
 - trigger-less readout of all detectors
 - online event reconstruction to correlate proton and muon signals
- trigger on small kink in muon track

higher Q^2

- recoil protons not stopped inside hydrogen volume
- replace hydrogen TPC by hydrogen volume surrounded by scintillator barrel

- stop protons in layers
- measure energy via Bragg peak
- faster trigger decision

- measurement of proton charge-radius with high-energy muon beam
 - unique opportunity to verify results from electron scattering
 - smaller corrections required
- first test measurement this year
 - compatibility of TPC with “broad” muon beam
 - correlation of proton and muon signals
