

Status of the ALiBaVa Systems in Freiburg

M. Breindl, M. Köhler, U. Parzefall, J. Preiss,
M. Walz, L. Wiik

Outline

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

- What do we have in Freiburg?
- Space resolved laser measurements
- Source measurements
- New cooling system
- Current problems
- Further plans and outlook

Laser Setup

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

- **Infrared laser**
- $\lambda = 972 \text{ nm}$, $E = 1.27 \text{ eV}$
- Laserfocus: $\sigma = 2.1 \text{ }\mu\text{m}$ 68% intensity in $4.2 \text{ }\mu\text{m}$
- **Tilting table**
- **Rotation table**
- **Linear stages for movement in x,y direction**
- Measure relative signal on detector

Radioactive Source Setup

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

two plastic scintillators for coincidence

support for the source

hybrid with detector

- ^{90}Sr source
- Activity: ~ 2 MBq
- $E(\beta^-)_{\text{max}} = 2.28$ MeV
- System in a freezer
- Min. sensor temp: -15 °C

Pedestal and Noise at 80V

ATLAS SCT Endcap Detector (n-type)

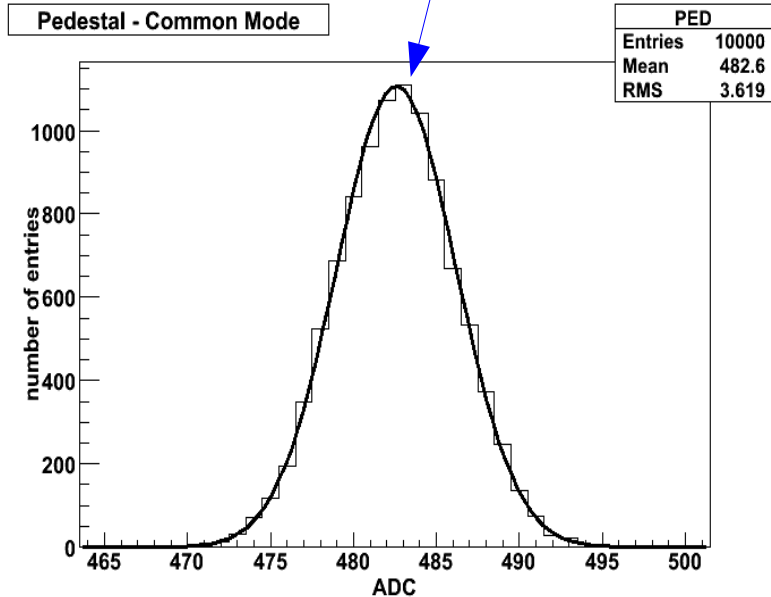

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

6 cm strip length

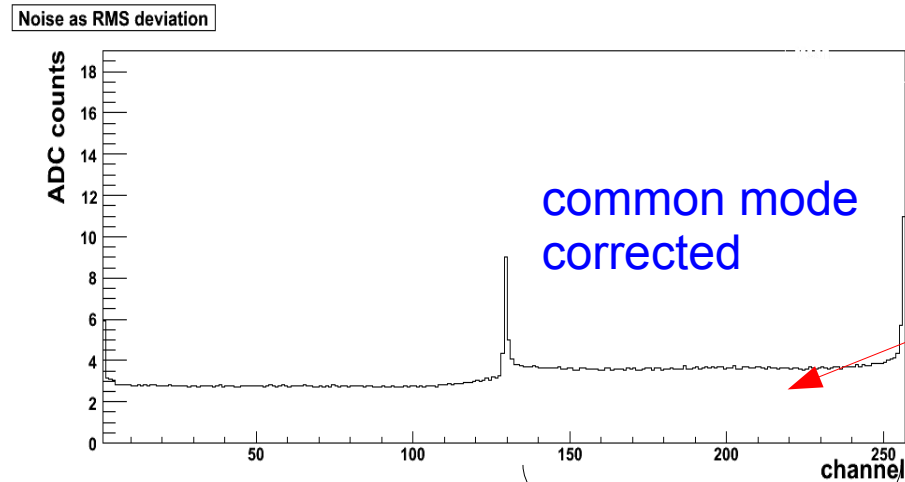

common mode corrected
pedestal data for channel 200
with a Gaussian fit

Noise for Each Channel

noise is
about 9
ADCs

common mode
corrected

noise is
about 3.5
ADCs

bonded Chip

Projection on channel=143

delay scan

strip 143

Delay Scan

- Delay between laser trigger and read out
- Delay can be varied in 1 ns steps
- Our delay: 1060 ns

Space-Resolved Laser Measurement

ATLAS SCT Endcap Detector (n-type)

Albert-Ludwigs-Universität Freiburg

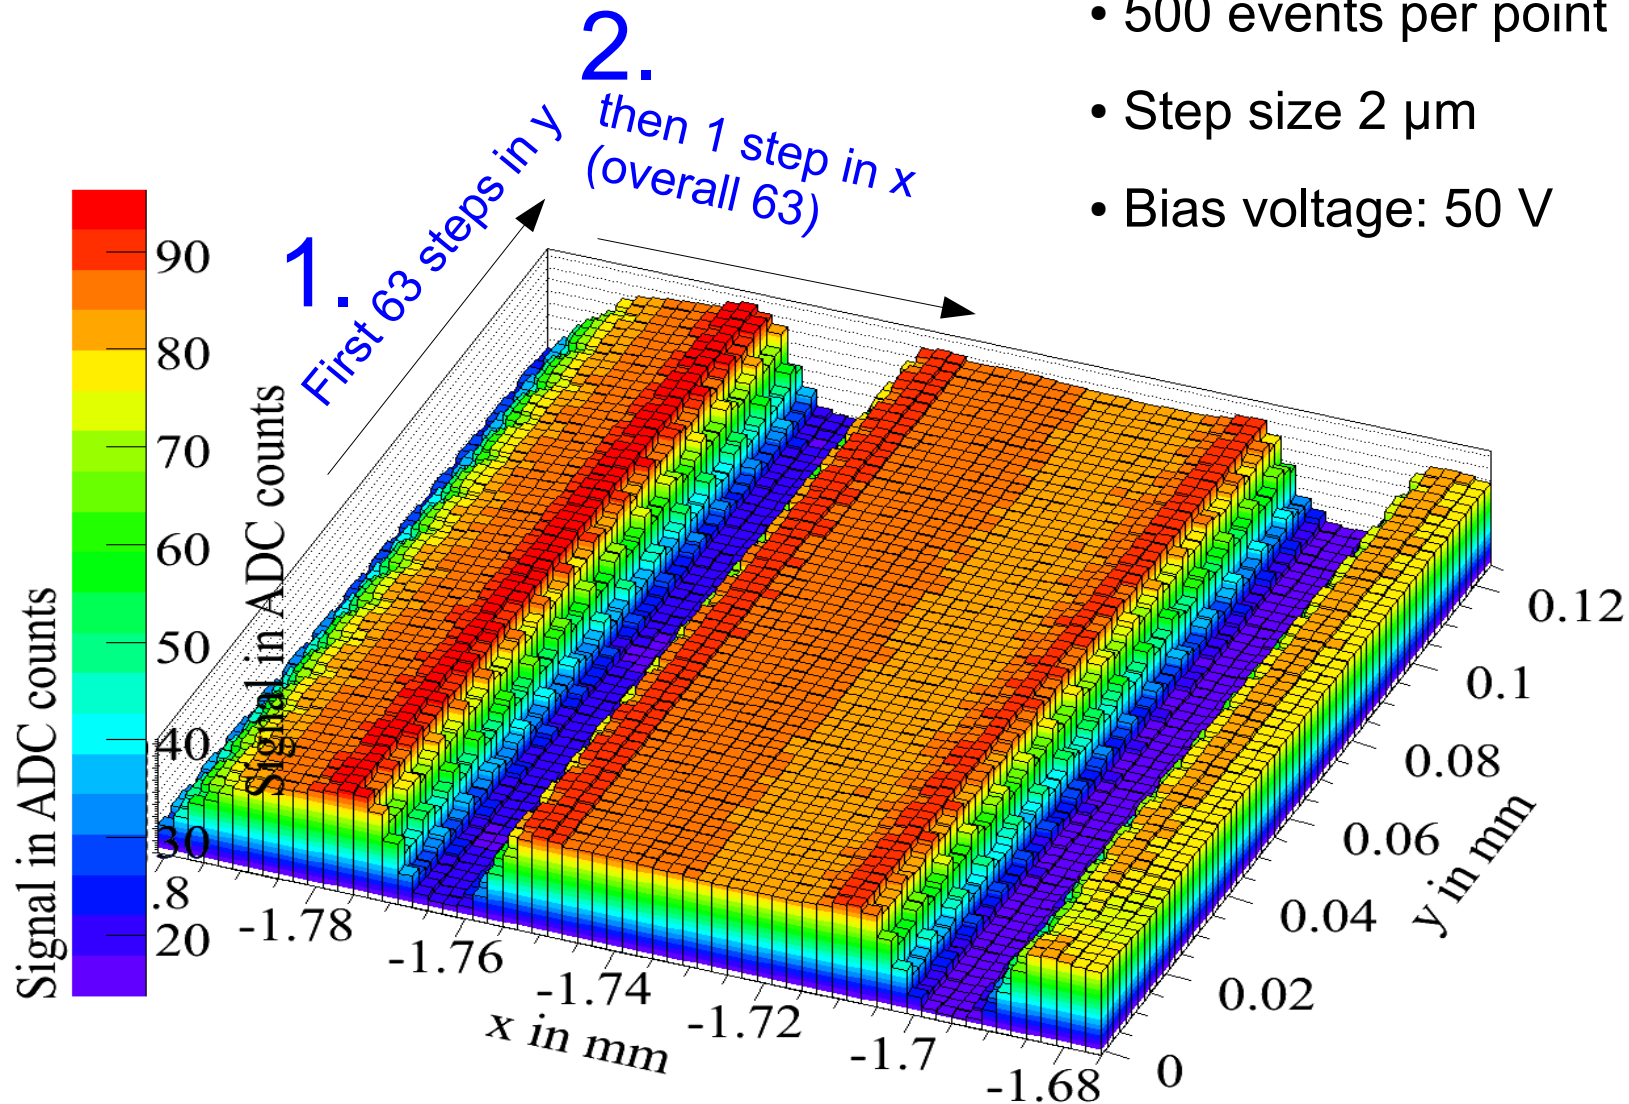

- Step size: 5 μm , bias voltage: 40 V
- Pitch $\sim 60 \mu\text{m}$ (wedge shape)
- Thickness: 285 μm , 6 cm strip length

- Depletion voltage. 60 - 80 V
- Signal is common mode corrected and pedestal subtracted
- Strips are clearly visible, due to laser reflection
- 500 events per point

Space-Resolved Laser Measurement ATLAS SCT Endcap Detector (n-type)

Albert-Ludwigs-Universität Freiburg

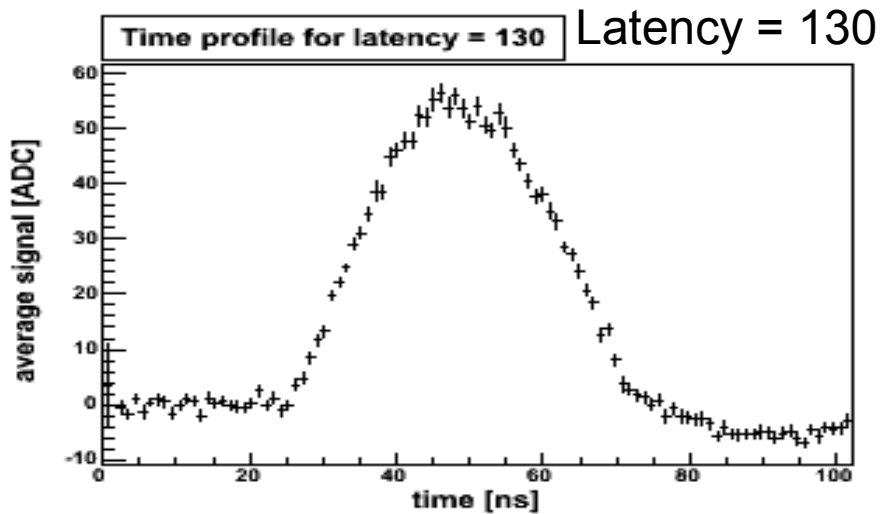

- 500 events per point
- Step size 2 μm
- Bias voltage: 50 V

Source Setup

Time Profile for Different Latency Bins

Albert-Ludwigs-Universität Freiburg

Default latency = 128

Best latency in our case = 129 because full baseline and peak visible

ALiBaVa Testpulse Shape Reconstructed by Using External Delay Boxes

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

Delayed only the test pulse

Differential testpulse sent from motherboard to daughterboard twice → two peaks

Default calibration runs done in 1 ns steps, also without delay for comparison

Chip 0 unbonded, chip 1 bonded to strip sensor

From Beetle reference manual

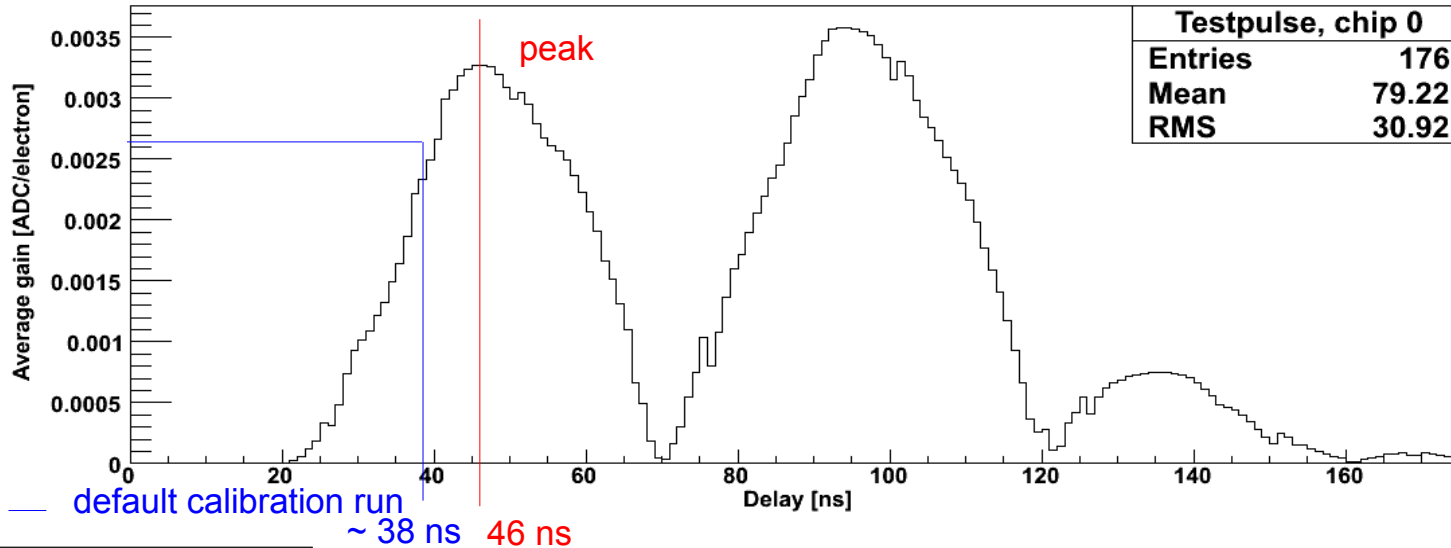

ALiBaVa Testpulse Shape Reconstructed by Using External Delay Boxes

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

Testpulse shape, chip 0

Gain of standard calibration run:
chip 0: **0.0026** ADC/e⁻
chip 1: **0.0012** ADC/e⁻

~ at 38 ns

→ Clearly off peak

Testpulse shape, chip 1

Already a delay of ~ 6 ns between the two beetle chips.

Delay between peak and default calibration run:

chip 0: ~ 8 ns

chip 1: ~ 14 ns

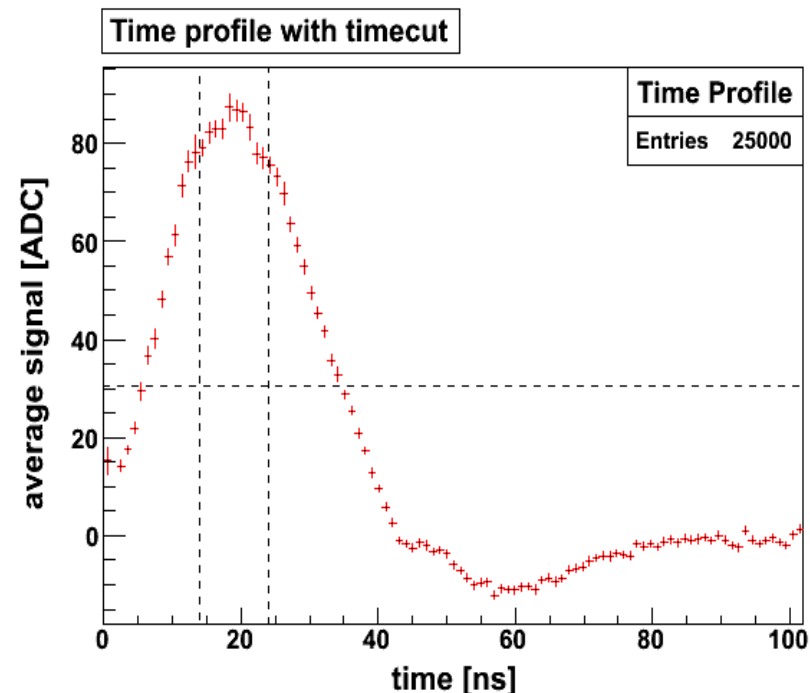

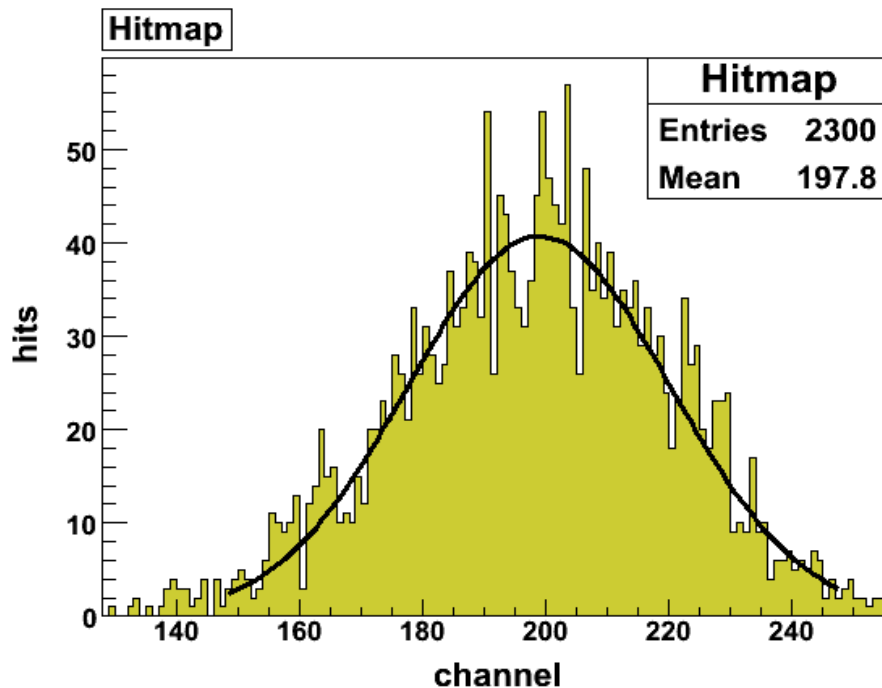

Source Setup

Hitmap and Time Profile

Albert-Ludwigs-Universität Freiburg

- Distance between source and detector: ~ 3 cm
- Szintillator size: ~ 4 mm
- Bias voltage: 250 V
- Time cut: 14 to 24 ns

Source Setup

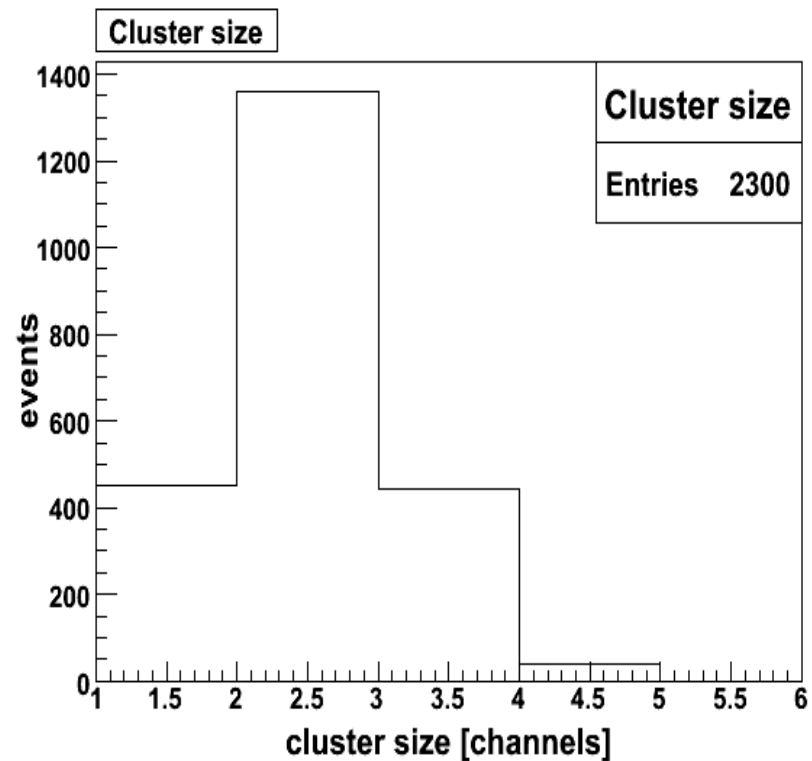

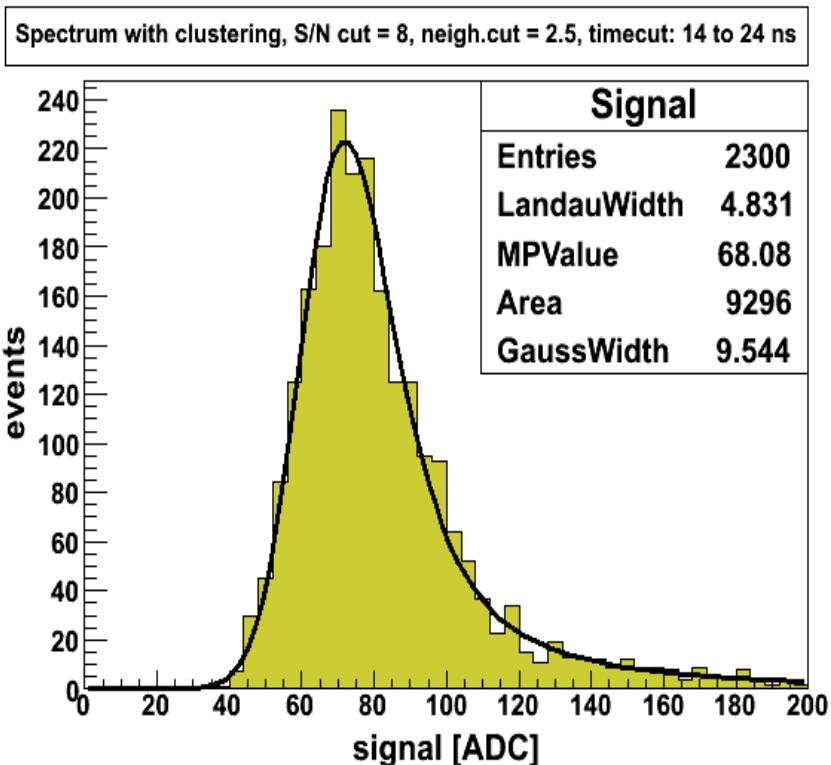

Spectrum with Clustering

Albert-Ludwigs-Universität Freiburg

Signal/Noise Cut

- Seed cut: 8
- Neighbour cut: 2.5

Strange Signal Behaviour

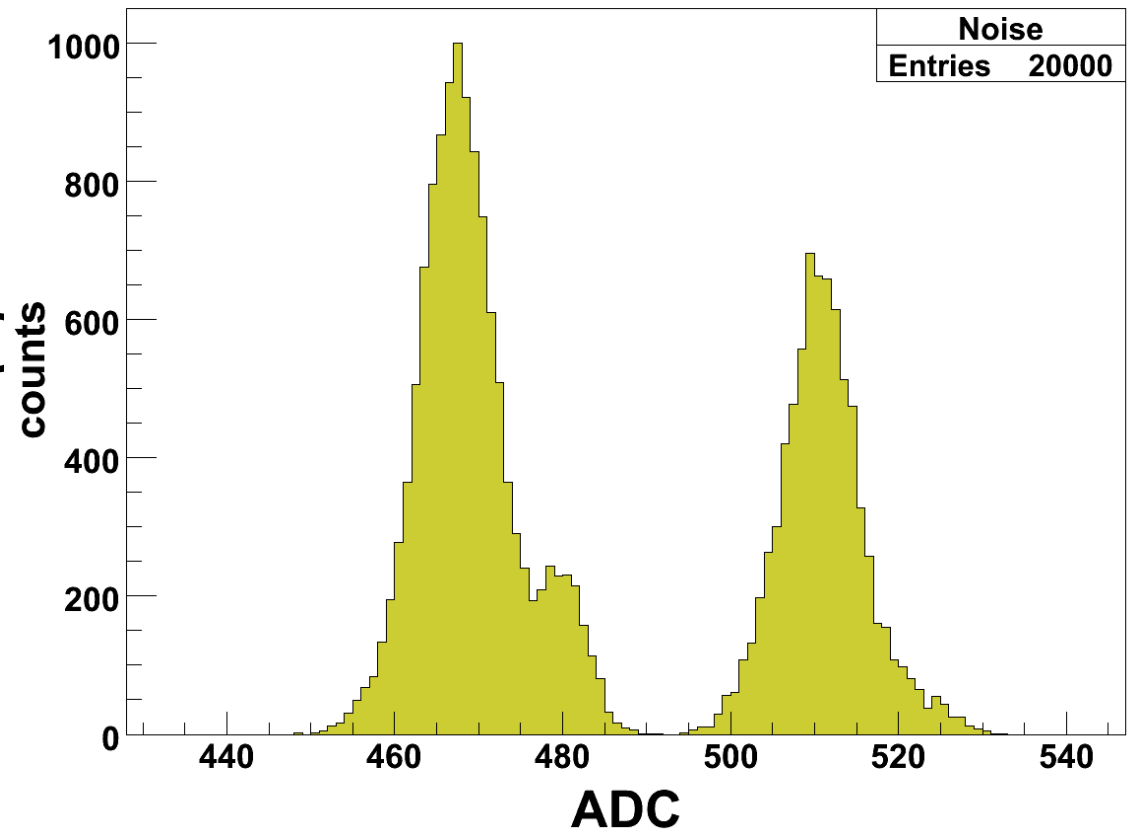

Pedestal Run @ -4.5°C and 100 V

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

- Projection for one channel (56)
- The mean pedestal for other chip is ~440 ADCs
- RAW data
- At least two peaks
- Also visible @ -15°C

Strange Signal Behaviour

Pedestal Run @ -4.5°C and 100 V

Albert-Ludwigs-Universität Freiburg

Processed data, channel vs. ADC counts

- Common mode corrected
- Pedestal subtracted
- Double peaks are seen at bonded and unbonded chips on 3 different DBs
- Only on the left chip (channels 0 - 127) on the board
- Not seen at room temp.

Has anyone else checked for this?

Cooling at the Laser

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

- The achieved temp. at the sensor is about -15°C
- We've ordered a new cooling system based on liquid nitrogen to achieve temperatures at the sensor below -40°C
- This new system can also be used at the source setup

Further Plans

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

- Write ALiBaVa plugin(s) to do voltage scans
- Work on double peak problematic
- Do space resolved laser measurements with unirradiated and irradiated detectors
- Install the new cooling system
- Measure high irradiated detectors
- Construct a safety switch off taking the dew point into account

Backup

- 40 MHz readout clock
- Data written in pipe with 187 bins – each of which has a length of 25 ns
- Latency has to be the time difference between read and write pointer.

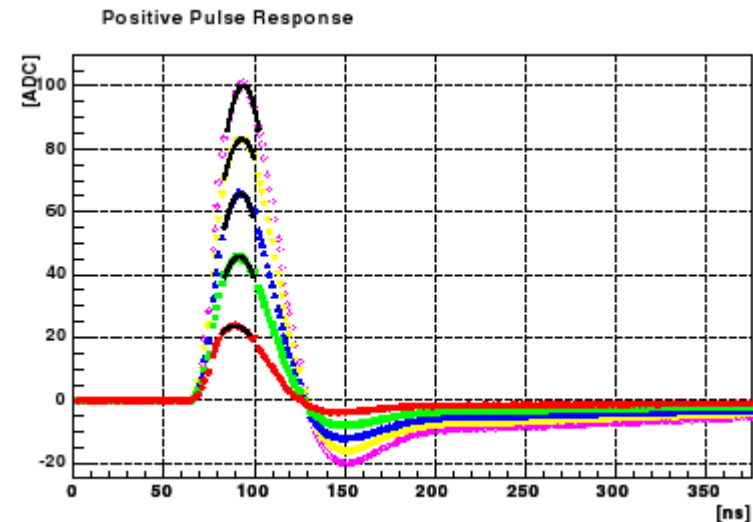

ALiBaVa Testpulse Shape Reconstructed by Using External Delay Boxes

Albert-Ludwigs-Universität Freiburg

UNI
FREIBURG

- Differential testpulse sent from motherboard to daughterboard twice → two peaks
- Measured latency bins 128 to 122, delay 0 to 25 ns
- Real delay = (latencymax-latency)*25-delay
- Real delay 0 ns = latency 128 / delay 25 ns; real delay 175 = latency 122 / delay 0 ns
- Default calibration runs done in 1 ns steps, also without delay for comparison
- Average gain for both beetle chips, respectively, plotted versus real delay
- Chip 0 unbonded, chip 1 bonded to strip sensor

Strange Signal Behaviour

Pedestal Run @ -4.5°C and 100 V

Albert-Ludwigs-Universität Freiburg

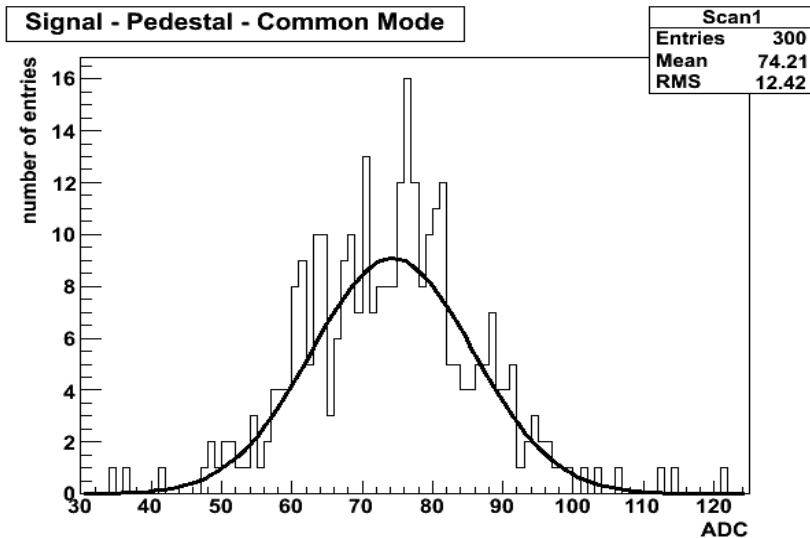

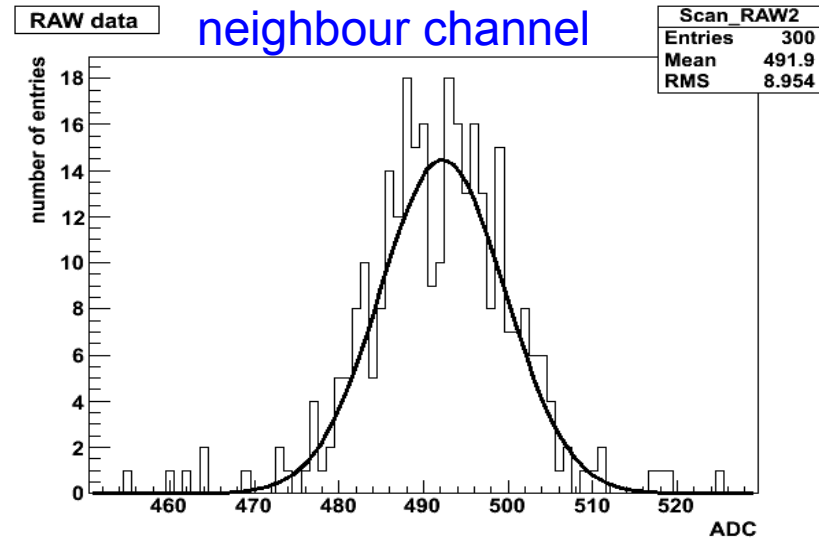

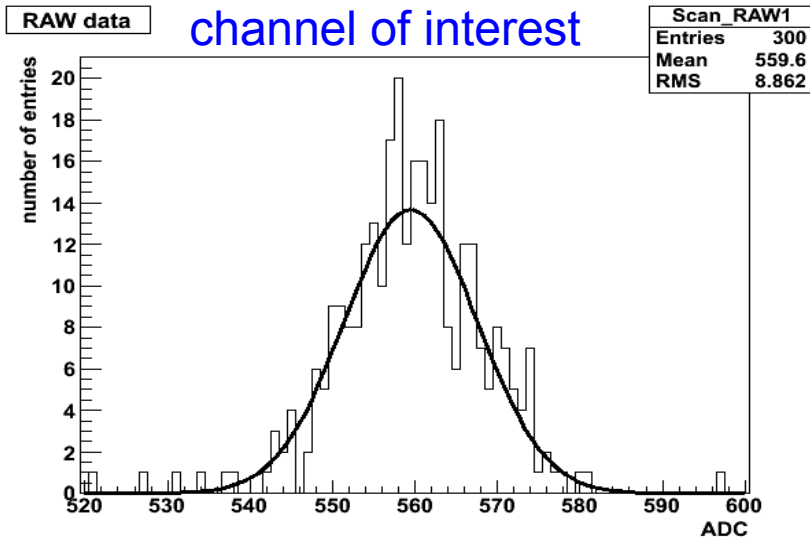

Signal vs. channel for four consecutive events

Space-Resolved Laser Measurement

One Point of the Scan (300 Events) in More Details

Albert-Ludwigs-Universität Freiburg

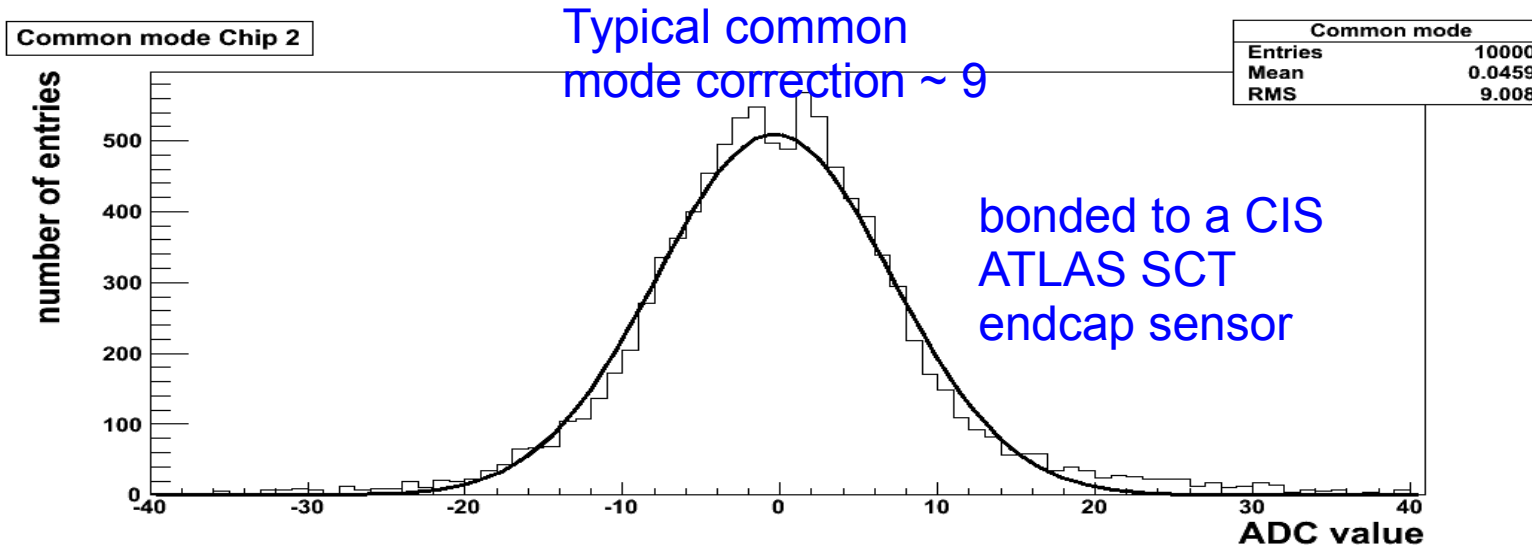

Common Mode

Albert-Ludwigs-Universität Freiburg

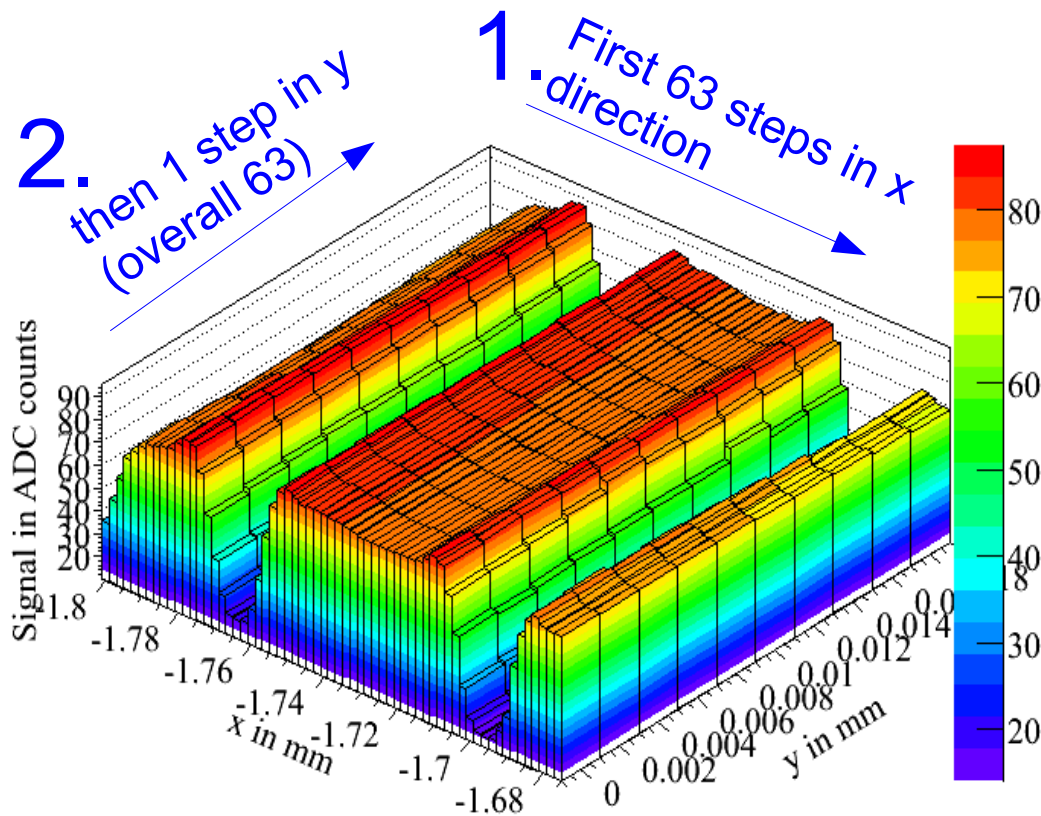

0'th order correction: for every event and chip mean value over all channels.

Space Resolved Laser Scan

Albert-Ludwigs-Universität Freiburg

- 2 μm step size
- 50 V bias voltage
- To check systematic
- Change scan direction
- No systematic anymore
