ENERGY SPECTRA OF ^{106}Cd

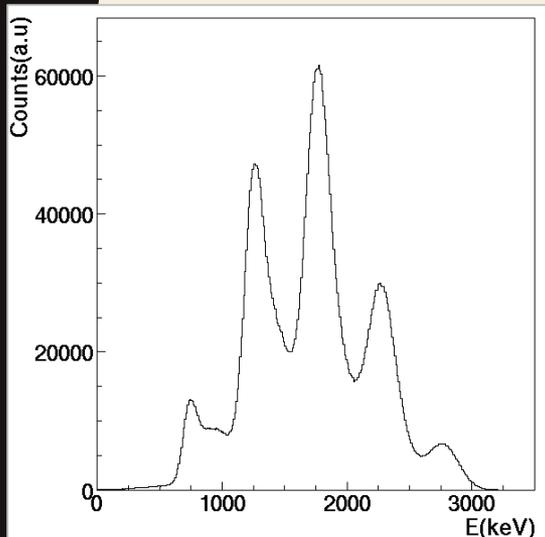

The energy spectra accumulated over **6935 h** by the $^{106}\text{CdWO}_4$ detector:

- in anticoincidence with the $^{nat}\text{CdWO}_4$ detectors
- in coincidence with event(s) in at least one of the $^{nat}\text{CdWO}_4$ detectors with energy:
 - $E > 200 \text{ keV}$

ESTIMATION OF SENSITIVITY

Expected signal for $^{106}\text{Cd } 0\nu 2\beta(0^+ \rightarrow 0^+)$:

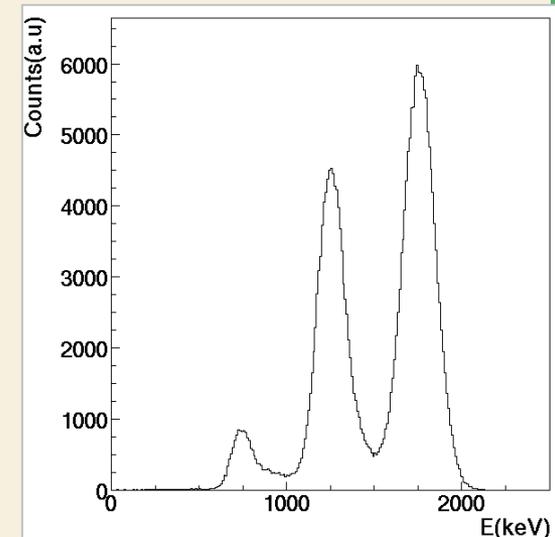

Spectrum of $^{106}\text{CdWO}_4$ detector

Spectrum of $^{106}\text{CdWO}_4$ detector when one of the two CdWO_4 detectors detects γ of 511 keV ($\pm 2\sigma$)

Spectrum of $^{106}\text{CdWO}_4$ detector when both the CdWO_4 detectors detect γ of 511 keV ($\pm 2\sigma$)

Sensitivity after 1yr in the hypothesis of about 30 background counts in [0.-3.] MeV:

$0\nu\epsilon\beta^+$ (g.s.): $T_{1/2} \approx 5 \times 10^{21}$ yr

$2\nu\epsilon\beta^+$ (g.s.): $T_{1/2} \approx 3 \times 10^{21}$ yr

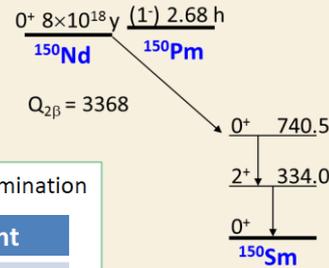

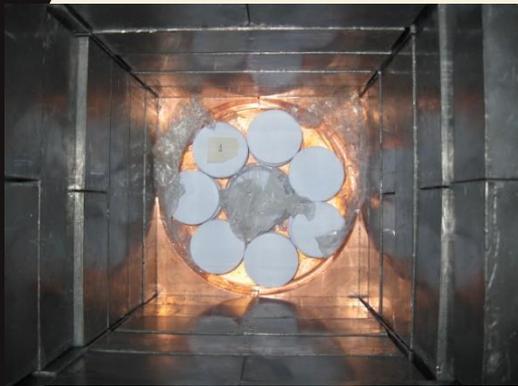

$2\nu 2\beta^+$ (g.s.): $T_{1/2} \approx 2 \times 10^{21}$ yr

In the region of theoretical predictions: $T_{1/2} \sim 10^{20} - 10^{22}$ yr

Note that, up to now, 2ν mode of the $2\beta^+$ processes has not been detected unambiguously: there are only indications for ^{130}Ba and ^{78}Kr
