

Search for electroweak production of supersymmetric particles in the two and three lepton final state at $\sqrt{s} = 13$ TeV with the ATLAS detector

Knut Oddvar Høie Vadla
University of Oslo

Spåtind 2018 – Nordic Conference on Particle Physics
05.01.2018

Introduction

- ❖ Presenting an overview of a search for electroweak production of supersymmetric particles in the two and three lepton final state
- ❖ Based on 2015+2016 data from the LHC – 36.1 fb⁻¹ of integrated luminosity taken with the ATLAS detector at $\sqrt{s} = 13$ TeV
- ❖ The results were presented at the LHCP 2017 conference in Shanghai, May 2017
 - ▶ [ATLAS-CONF-2017-039](#)

Supersymmetry

Supersymmetry (SUSY) is a popular extension of the Standard Model

- ❖ Spacetime symmetry between fermions and bosons
- ❖ Predicts a new bosonic (fermionic) superpartner for every SM fermion (boson), plus an extra Higgs doublet
- ❖ Provides elegant solutions to:
 - The hierarchy problem
 - Gauge coupling unification
 - Dark matter candidates
- ❖ If R-parity is conserved: $R = (-1)^{3B+L+2s}$
 - SUSY particles produced in pairs
 - The lightest SUSY particle (LSP) is stable
 - A weakly interacting LSP is a good candidate for dark matter (WIMP)

Search for electroweak production of sparticles with the ATLAS detector

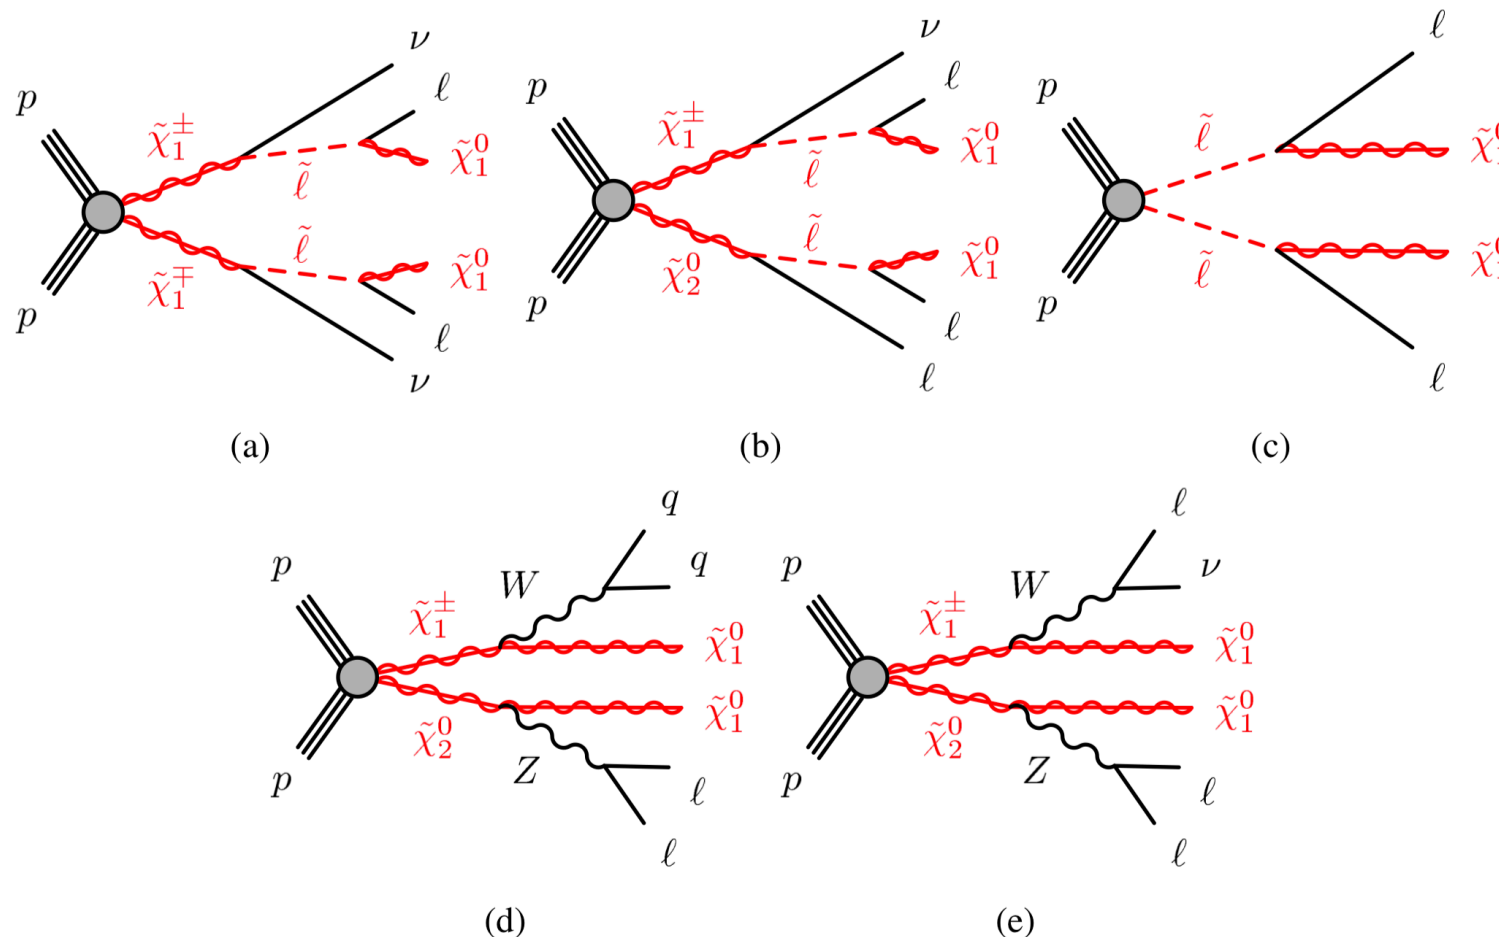

Proton-proton collisions at the LHC:

- ▶ Color charged sparticles (squarks and gluinos) will have significantly larger production cross-section than non-colored sparticles (charginos, neutralinos and sleptons) of equal masses
- ▶ However, if squarks and gluinos are significantly heavier, charginos, neutralinos and sleptons could dominate the production cross-section at the LHC
- ▶ No sign of squarks and gluinos up to ~ 2 TeV yet — electroweak production getting increasingly relevant

Signal models

- The Minimal Supersymmetric Standard Model (MSSM) adds over 100 free parameters to the SM — impossible to explore all scenarios in a search
- Simplified models:
 - Assuming 100 % branching fraction to the decay modes in the model
 - Only 2 free parameters: mass of pair produced sparticles and mass of the LSP

Background estimation

- ❖ Irreducible backgrounds – containing prompt, isolated leptons – are taken from Monte Carlo
- ❖ Reducible backgrounds – containing ‘fake’/non-prompt leptons from semi-leptonic decays or misidentification of jets, or photon-conversion – are estimated by data-driven methods
- ❖ Some of the main background processes are in addition fitted to data in control regions (CRs) and validated in dedicated validation regions (VRs)
- ❖ Dominant backgrounds:
 - ▶ 2L+0jets: diboson
 - ▶ 2L+jets: processes with an on-shell Z-boson – diboson, Z+jets
 - ▶ 3L: WZ

Background estimation summary			
Channel	$2\ell+0\text{jets}$	$2\ell+\text{jets}$	3ℓ
Fake leptons	Matrix method (MM)		Fake factor method (FF)
$t\bar{t} + Wt$	CR	MC	FF
VV	CR	MC	CR (WZ-only)
$Z/\gamma+\text{jets}$	MC	$\gamma+\text{jet}$ template	FF
Higgs/ VVV / $\text{top}+V$	MC		

Systematic uncertainties

- ❖ Largest systematic uncertainties:
 - ▶ Diboson modelling
 - ▶ Jet energy scale and resolution
 - ▶ MET modelling
- ❖ Dominant uncertainties in the 2L+jets channel:
 - ▶ Diboson modelling (30-40%)
 - ▶ Data-driven Z+jets estimation (42-71%)
- ❖ The binned SRs in the 2L+0jets and 3L channels are dominated by statistical uncertainties on the background estimates
 - ▶ 10 - 70% in the higher mass regions of the 2L+0jets channel
 - ▶ 5 - 30% in the 3L channel

Final states with 2L+0jets

- ❖ Targets pair production of C1 (lightest chargino) and sleptons
- ❖ Jets are vetoed
- ❖ Signal regions (SRs) based on the 'stransverse' mass m_{T2} and the dilepton invariant mass $m_{\ell\ell}$
 - ▶ Binned SRs for exclusion
 - ▶ Inclusive SRs for discovery

$$m_{T2} = \min_{\mathbf{q}_T} \left[\max \left(m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right]$$

$$m_T(\mathbf{p}_T, \mathbf{q}_T) = \sqrt{2(p_T q_T - \mathbf{p}_T \cdot \mathbf{q}_T)}$$

2ℓ+0jets binned signal region definitions			
$m_{T2}[\text{GeV}]$	$m_{\ell\ell} [\text{GeV}]$	SF bin	DF bin
100-150	111-150	SR2-SF-a	SR2-DF-a
	150-200	SR2-SF-b	
	200-300	SR2-SF-c	
	> 300	SR2-SF-d	
150-200	111-150	SR2-SF-e	SR2-DF-b
	150-200	SR2-SF-f	
	200-300	SR2-SF-g	
	> 300	SR2-SF-h	
200-300	111-150	SR2-SF-i	SR2-DF-c
	150-200	SR2-SF-j	
	200-300	SR2-SF-k	
	> 300	SR2-SF-l	
> 300	> 111	SR2-SF-m	SR2-DF-d
2ℓ+0jets inclusive signal region definitions			
> 100	> 111	SR2-SF-loose	-
> 130	> 300	SR2-SF-tight	-
> 100	-	-	SR2-DF-100
> 150	-	-	SR2-DF-150
> 200	-	-	SR2-DF-200
> 300	-	-	SR2-DF-300

Final states with 2L+0jets

(a) $m_{\ell\ell}$ distribution in SR2-SF-loose

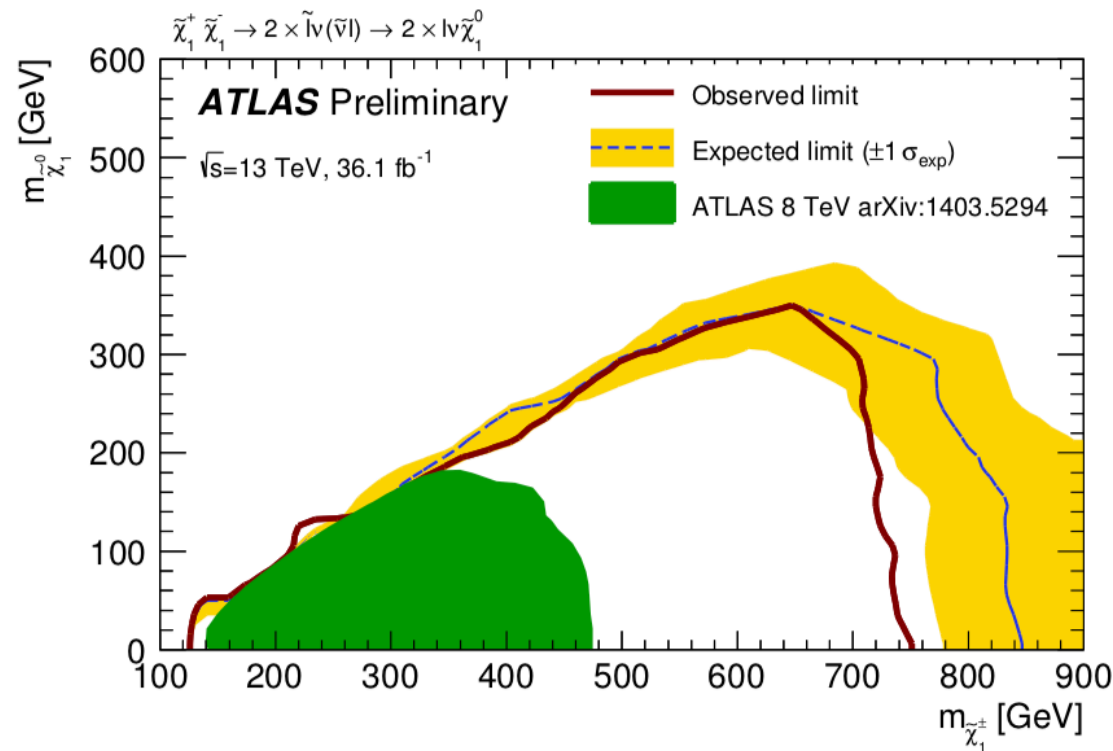

(b) m_{T2} distribution in SR2-SF-loose

(c) m_{T2} distribution in SR2-DF-100

Final states with 2L+0jets

- ❖ No significant deviations from the SM
- ❖ Set lower limits on sparticle masses at 95 % CL:
 - C1 masses < 750 GeV excluded for massless LSP
 - Slepton masses < 500 GeV excluded for massless LSP

(a) Direct $\tilde{\chi}_1^+ \tilde{\chi}_1^-$ pair production
with \tilde{l} -mediated decays

(b) Direct \tilde{l} pair production
(combined left-handed, \tilde{l}_L ,
and right-handed sleptons, \tilde{l}_R)

Final states with 2L+jets

- ❖ Targets pair production of C1 and N2 (next-to-lightest neutralino) decaying via SM gauge bosons

- ▶ $Z \rightarrow 2$ SFOS leptons
- ▶ $W \rightarrow 2$ jets

- ❖ Require at least 2 jets
- ❖ Signal regions target different mass splittings Δm between the pair produced sparticles and the LSP
 - ▶ High Δm : MET > 150 GeV
 - ▶ Intermediate Δm : MET > 250 GeV
 - ▶ Low Δm : MET > 100 GeV
 - 2 SRs: w/ and w/o ISR

2 ℓ +jets signal region definitions				
	SR2-int	SR2-high	SR2-low-2J	SR2-low-3J
$n_{\text{non-}b\text{-tagged jets}}$	≥ 2		2	3-5
$m_{\ell\ell}$ [GeV]	81-101		81-101	86-96

p_T^W [GeV]	>100			
m_{T2} [GeV]	>100			
$\Delta R_{(jj)}$	<1.5			<2.2
$\Delta R_{(\ell\ell)}$	<1.8			
$\Delta\phi_{(\vec{E}_T^{\text{miss}}, Z)}$			< 0.8	
$\Delta\phi_{(\vec{E}_T^{\text{miss}}, W)}$	0.5-3.0		> 1.5	< 2.2
E_T^{miss}/p_T^Z			0.6 – 1.6	
E_T^{miss}/p_T^W			< 0.8	
$\Delta\phi_{(\vec{E}_T^{\text{miss}}, \text{ISR})}$				> 2.4
$\Delta\phi_{(\vec{E}_T^{\text{miss}}, \text{jet1})}$				> 2.6
$E_T^{\text{miss}}/\text{ISR}$				0.4-0.8
$ \eta(Z) $				< 1.6
p_T^{jet3} [GeV]				> 30

Final states with 2L+jets

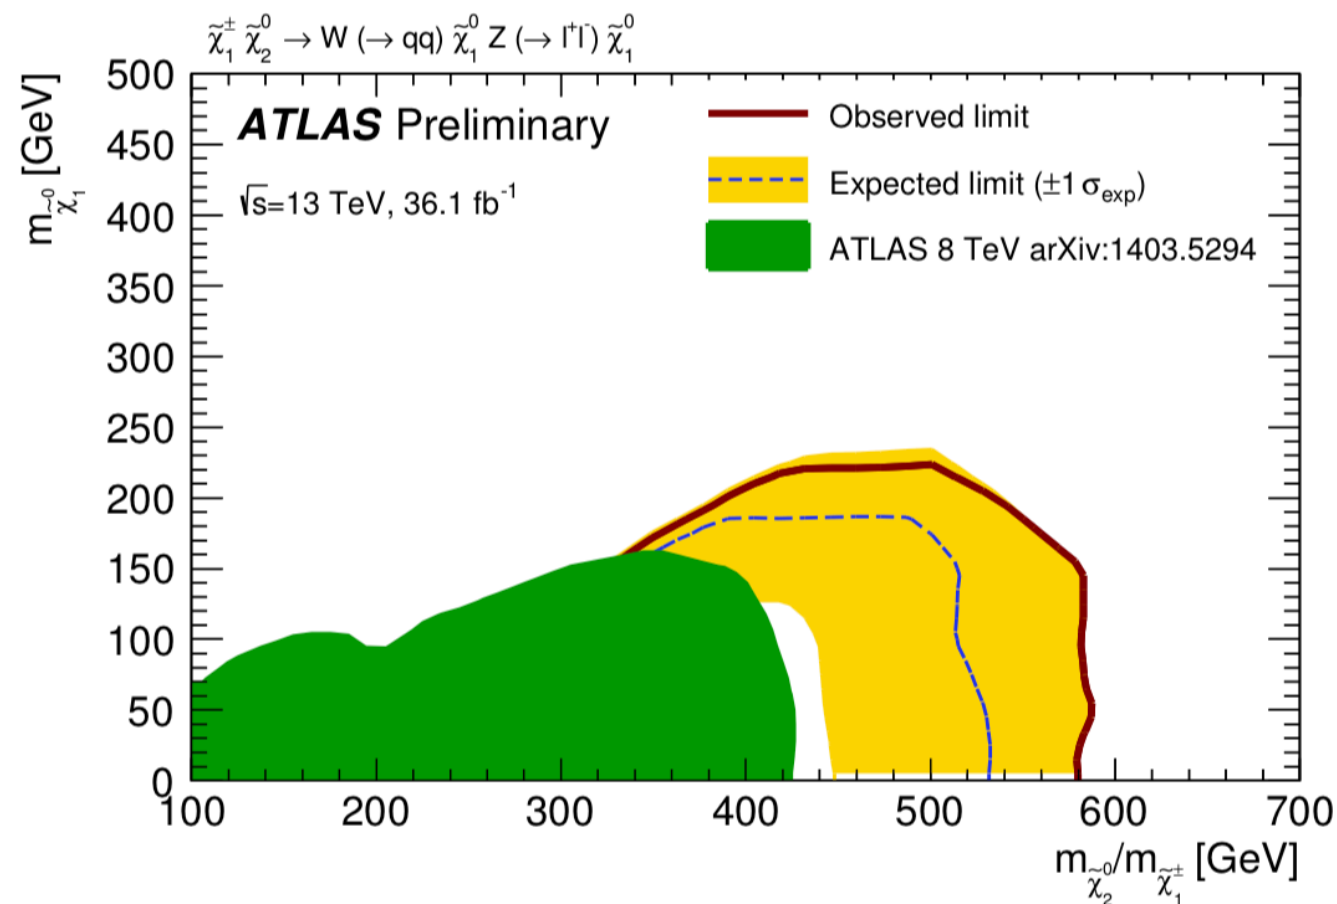

(a) E_T^{miss} distribution in SR2-int/high

(b) E_T^{miss} distribution in SR2-low

Final states with 2L+jets

- ❖ No significant deviations from the SM
- ❖ Set lower limits on sparticle masses at 95 % CL:
 - ▶ C1/N2 masses < 580 GeV excluded for massless LSP

Final states with 3L

- ❖ Targets pair production of C1 and N2, decaying via sleptons or SM gauge bosons to 3 leptons
- ❖ Binned signal regions
 - ▶ Slepton mediated decays: no m_{ll} resonance, binned in 3rd lepton p_T
 - ▶ WZ mediated decays: on-shell Z, binned in MET and m_T^{\min}

3ℓ binned signal region definitions							
m_{SFOS} [GeV]	$E_{\text{T}}^{\text{miss}}$ [GeV]	$p_{\text{T}}^{\ell_3}$ [GeV]	$n_{\text{non-}b\text{-tagged jets}}$	$m_{\text{T}}^{\text{min}}$ [GeV]	$p_{\text{T}}^{\ell\ell\ell}$ [GeV]	$p_{\text{T}}^{\text{jet1}}$ [GeV]	Bins

Final states with 3L

(a) E_T^{miss} distribution in SR3-WZ-0Ja to c

(b) E_T^{miss} distribution in SR3-WZ-1Ja

(c) E_T^{miss} distribution SR3-WZ-1Jb

(d) E_T^{miss} distribution SR3-WZ-1Jc

Final states with 2L+0jets

- ❖ No significant deviations from the SM
- ❖ Set lower limits on sparticle masses at 95 % CL:
 - WZ mediated decays: C1/N2 masses < 380 GeV excluded for massless LSP
 - Slepton mediated decays: C1/N2 masses < 1.1 TeV excluded for massless LSP

(a) Direct $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production
with $\tilde{\ell}$ -mediated decays

(b) Direct $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production
with WZ-mediated decays

Conclusions and outlook

- ❖ We see no significant deviations from the SM in searches for sparticles produced in electroweak processes with two and three leptons in the final state
- ❖ Continue to exclude phase space past LHC Run 1 limits
- ❖ With strong limits on squarks and gluinos, electroweak production of charginos, neutralinos and sleptons are becoming increasingly relevant
- ❖ Efforts ongoing to target more compressed mass splitting scenarios
