

Using Machine Learning to improve particle identification in the ATLAS experiment.

Friday, January 5, 2018 9:45 PM (5 minutes)

Currently, the method for identifying particles in the ATLAS experiment relies on Likelihood estimates constructed from MC simulations. These are good and efficient, but the method has a few shortcomings compared to using ML algorithms. I will present our work so far in using BDTs to classify electrons, some preliminary results, and some of our future hopes and dreams.

Summary
