

Preparing for Dark Matter Particle Discovery

Monday 11 June 2018 - Friday 15 June 2018

Chalmers University of Technology

Book of Abstracts

Contents

Welcome	1
Toward minimal assumptions for WIMP dark matter	1
From EW scale to DM direct detection	1
Decaying Dark Matter with or without SUSY	1
Searching for dark matter particle properties in astrophysical data	1
The parameter space of ultra-light axions	1
Supermassive Black Hole Formation Due to Dark Matter Particle Annihilation Heating	1
Results from a One Tonne-Year Dark Matter Search with XENON1T	1
Review of direct Dark Matter searches	2
Light in the Dark –a Light Dark Matter eXperiment (LDMX)	2
Single Photon Counter based on the Al-Al Josephson Junction at 14 GHz for searching Galactic Axions	2
Generalized spin-independent WIMP-nucleus scattering from chiral effective field theory	2
Ab Initio Nuclear Structure Calculations for Dark Matter Direct Detection	2
Consequences of a XENONnT/LZ signal for the LHC and thermal dark matter production	2
Surrogate Models for Direct Dark Matter Detection	2
Addressing theoretical uncertainties in direct detection experiments	3
Impact of astrophysical uncertainties on WIMP direct (and indirect) detection	3
Dark Matter Model or Mass, but Not Both: Assessing Near-Future Direct Searches with Benchmark-free Forecasting	3
Dark matter particle search with the CRESST-III experiment	3
First Sub-GeV Dark Matter Search Results with SuperCDMS using a Single Electron-Hole-Pair Detector	3
Projected sensitivity of the LUX-ZEPLIN experiment to WIMP dark matter	3
On velocity-dependent dark matter annihilations in dwarf satellites	3

Dark Matter Searches with Charged Cosmic Rays	4
High energy neutrinos from cosmic ray interactions in the sun	4
A global study of the extended scalar singlet model	4
Pinning down light dark matter	4
Homing in on dark matter with GAMBIT	4
DarkSUSY 6	4
DM Prospects in the APPEC EU Astroparticle Roadmap 2017-2026	4
Onsala Space Observatory: an overview of current and future radio astronomy facilities	5

1

Welcome

27

Toward minimal assumptions for WIMP dark matter

42

From EW scale to DM direct detection

29

Decaying Dark Matter with or without SUSY

30

Searching for dark matter particle properties in astrophysical data

39

The parameter space of ultra-light axions

37

Supermassive Black Hole Formation Due to Dark Matter Particle Annihilation Heating

32

Results from a One Tonne-Year Dark Matter Search with XENON1T

31

Review of direct Dark Matter searches

38

Light in the Dark –a Light Dark Matter eXperiment (LDMX)

54

Single Photon Counter based on the Al-Al Josephson Junction at 14 GHz for searching Galactic Axions

33

Generalized spin-independent WIMP-nucleus scattering from chiral effective field theory

34

Ab Initio Nuclear Structure Calculations for Dark Matter Direct Detection

35

Consequences of a XENONnT/LZ signal for the LHC and thermal dark matter production

36

Surrogate Models for Direct Dark Matter Detection

28

Addressing theoretical uncertainties in direct detection experiments

41

Impact of astrophysical uncertainties on WIMP direct (and indirect) detection

43

Dark Matter Model or Mass, but Not Both: Assessing Near-Future Direct Searches with Benchmark-free Forecasting

44

Dark matter particle search with the CRESST-III experiment

45

First Sub-GeV Dark Matter Search Results with SuperCDMS using a Single Electron-Hole-Pair Detector

46

Projected sensitivity of the LUX-ZEPLIN experiment to WIMP dark matter

49

On velocity-dependent dark matter annihilations in dwarf satellites

48

Dark Matter Searches with Charged Cosmic Rays

50

High energy neutrinos from cosmic ray interactions in the sun

40

A global study of the extended scalar singlet model

52

Pinning down light dark matter

51

Homing in on dark matter with GAMBIT

47

DarkSUSY 6

53

DM Prospects in the APPEC EU Astroparticle Roadmap 2017-2026

55

Onsala Space Observatory: an overview of current and future radio astronomy facilities
