

User Logic Protocol Check Simulation

Ola S Grøttvik – 22nd September 2017

Features

- Automatic configuration of User Logic via Avalon by provided config.txt using Avalon VVC
- Concurrent data injection with multiple GBT links by provided data*.txt using GBT VVC
- Concurrent test of packet protocol on both User Logic Outputs
- Purpose: To be able to test various User Logic implementations and let each detector group provide their own realistic data streams and configuration
- Possible to extend the test to both check protocol AND data
- Assumption: User Logic will always have the same interface, with varying amount of GBT links

Directory overview

— config.txt	— Contain instructions to configure User Logic
— data0.txt	— Contain data stream for link 0
— data1.txt	— Contain data stream for link 1, * can increase # links
— README.md	
— script	— Compilation scripts
— 1_compile_src.do	— Compilation of User Logic source. May be edited.
— 2_compile_util.do	
— 3_compile_tb_dep_ex_util.do	
— 4_compile_tb.do	
— 5_simulate_tb.do	
— compile_all_and_sim_tb.do	
— wave_tb.do	
— sim	
— tb	
— test_pkg.vhd	— Contain the test procedure. Easily configurable
— text_parse_pkg.vhd	— Functions and procedures for parsing text files
— user_logic_tb.vhd	— Instantiation of DUT, test sequencer, etc

NOTE – This directory is found as part of the simulation repository. The GBT VVC is located in another directory. The location of the user logic source is specified in common.ini.

Configuration of User Logic

• Text file with fixed format	Address	Data
• Requires exact amount of bits	00000010	FFFFFFFF
• TB will automatically write the values to the specified registers on startup	00000014	AAAAAAAA
• No action occurs until after instructions are executed	00000018	BBBBBBBB
• Parsing does not like extra lines, etc	0000001C	11111111
	00000020	22222222
	00000024	33333333
	00000028	44444444
	0000002C	55555555
	00000030	66666666
	00000034	88888888
	00000038	99999999
	0000003C	CCCCCCCC

FAILURE #1 ***

Trying to send undefined Avalon instructions! Check your config.txt file.

GBT Links

- # of GBT Links specified with constant NUM_GBT_LINKS in user_logic_tb.vhd. Default value=2
- One data file for each link
- Requires exact amount of bits
- Parsing is done for all links before transmission starts automatically when configuration is completed

GBT Data Words

```
00000000000000000000000000000000
0000000000000000000000000100000000
00000000000000000000000000000000

```

Steps for running

- Modify common.ini to point to User Logic source directory
- Add all source files to 1_compile_src.do
 - If the given User Logic requires other libraries, the compilation of these libraries may also be done from this file
- Provide config.txt and a given number of data*.txt files
- Select value for NUM_GBT_LINKS constant
- Run with: vsim -do compile_all_and_sim_tb.do
