

Self-Made Particle Detectors for High Schools and Universities

Andreas Döder, Matthias Schott (JGU Mainz)
Günter Quast, Lars Vielsack (KIT)

- Cloud chamber construction
- Kamiokanne – A coffee pot Cherenkov detector
- Readout framework

Cloud Chamber

Working principle

- Radiation ionizes a gas in an oversaturated condition
- Ions act as condensation nuclei for a cloud formation
→ chemtrails of airplanes

Expansion Cloud Chamber

- Oversaturation reached by volume expansion
- No continuous operation

Diffusion Cloud Chamber

- Oversaturation reached by temperature gradient
- Long and stable operation

Working principle

- Radiation ionizes a gas in an oversaturated condition
- Ions act as condensation nuclei for a cloud formation
→ chemtrails of airplanes

Expansion Cloud Chamber

- Oversaturation reached by volume expansion
- No continuous operation

Diffusion Cloud Chamber

- Oversaturation reached by temperature gradient
- Long and stable operation

Diffusion Cloud Chamber

- Top (glass) cover
- Isopropanol reservoir
- HV for ion collection (not necessary)

- Oversaturated layer
- Droplet trace formation
- Liquid layer
- Black base plate for better contrast together with tangential light
- Cooling unit

$\Delta T > 45^{\circ}C$

Thermal stable oversaturated layer

→ uniform temperature distribution + tight enhousing

Cooling Technologies

Technology	Pro	Contra
Dry Ice Cooling	<ul style="list-style-type: none">▪ Quick to build▪ Little material effort	<ul style="list-style-type: none">▪ Dry ice not easily available▪ Limited operation time
Peltier Cooling	<ul style="list-style-type: none">▪ Long operation time▪ Peltier easy to buy and safe to handle	<ul style="list-style-type: none">▪ Heat transfer from Peltier elements necessary
Refrigerating Compressor Cooling	<ul style="list-style-type: none">▪ Long operation time	<ul style="list-style-type: none">▪ Compressor technology has to be bought as is

Cooling Technologies

Technology	Pro	Contra
Dry Ice Cooling	<ul style="list-style-type: none">▪ Quick to build▪ Little material effort	<ul style="list-style-type: none">▪ Dry ice not easily available▪ Limited operation time
Peltier Cooling 	<ul style="list-style-type: none">▪ Long operation time▪ Peltier easy to buy and safe to handle	<ul style="list-style-type: none">▪ Heat transfer from Peltier elements necessary
Refrigerating Compressor Cooling	<ul style="list-style-type: none">▪ Long operation time	<ul style="list-style-type: none">▪ Compressor technology has to be bought as is

Peltier Characteristics

- Peltier under study (chosen by cost and easy purchase): TEC1-12706
- Size: $40 \cdot 40 \text{ mm}^2$
- Theoretical cooling capability: $\Delta T = 75 \text{ K}$
- Measured cooling capability: $\Delta T = 43 \text{ K}$
- Limited by heat transport from the downside
- → double layer of Peltier elements necessary for $\Delta T > 45 \text{ K}$ for cloud chamber operation
- 12 V supply voltage for lower layer, 5 V for upper layer
- Active area: $150 \cdot 150 \text{ mm}^2$ with in total 13 Peltier
- Uniformity of the Peltier element: $\pm 3 \text{ K}$
- 2 mm copper plates used to uniform temperature distribution
- Temperature coupling with generous spread thermal paste

Cooling unit

- Heat transport from the downside of the Peltier sandwich by water cooling
- Couple Peltire to heat sink with cooling rib in water basin
- Water either continuously flushed to sink or cooling circuit
- Circuit be implemented with standard computer cooling supply
- Pump (2) transports water from big reservoir (1) through radiators (3) to the water basin under the Peltier elements (4)
- !!! Stable gluing of the basin needed since water is under pressure !!!

Heat sink studies

- Some physics fun during construction: Simulation of the water flow in the basin under the Peltier elements
- Several studies like thermal calculations of the water cooling circuit or the air cooling of the power supplies, electrical power consumption or vapour formation make it more than a pure ,mechanical' tasks

Total layout

- Isopropanol reservoir in a vlies tissue under the top cover
- Illumination with LED band around the cooling plate
- Powered by computer power supplies
 - Separate power supply for the Peltiers due to large consumption and to operate water cooling independently
- Whole setup hosted in moveable cabinet

Final Cloud chamber

Cost estimation

Peltier elements (10)

30 USD

Power supply

60 USD

Copper plates (2)

40 USD

Plexiglas for hood

10 USD

Cooling ribs

25 USD

Thermal paste

20 USD

Basic cloud chamber
165 USD

Power supply

35 USD

Radiator (2)

90 USD

Pump

45 USD

Water cooling circuit
180 USD

Kamiokanne

Kamiokanne detector

- Water Cherenkov detector in a coffee can (German: ‚Kanne‘)
- Photomultiplier coupled to a water filled thermal can
- Traversing cosmic muons create Cherenkov light in the water
- Developed 1997 at JGU Mainz, until then in use for student courses and school outreach at several German universities

Measurements and Outlook

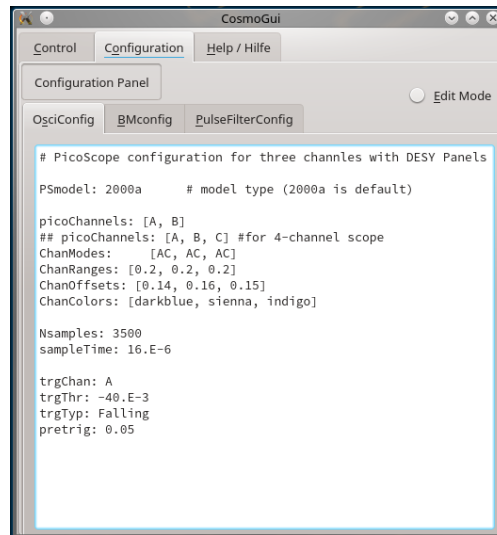

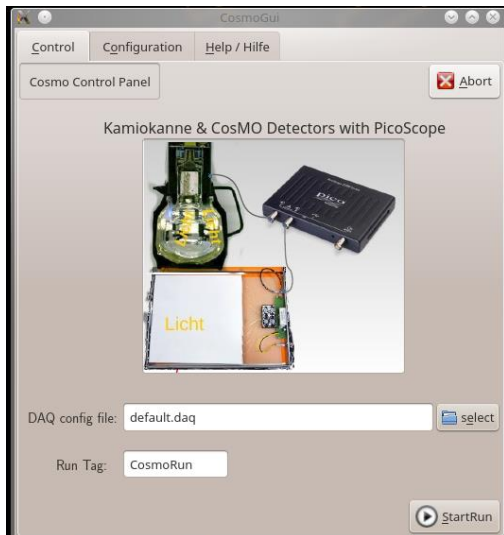

- Possible Measurements
 - Count rates at different heights and with different absorbers
 - Concept of dark count (can without water)
 - Signal / noise ratio estimation
 - Muon lifetime by with muons decaying in the water → double pulse
 -

- Outlook
 - HV needed for the PMT gives legal issues in the usage with school students
 - Readout with a PMT with integrated HV generation
 - Readout with a SiPM and light guiding fibers under development

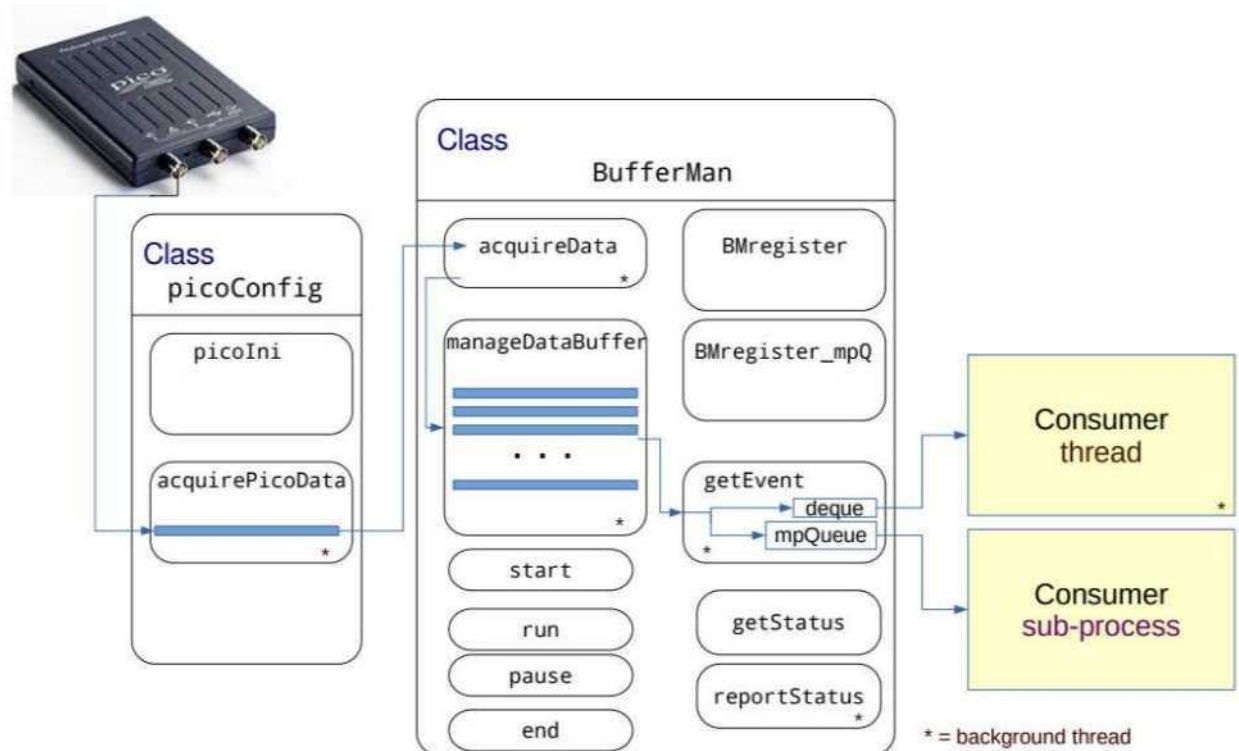

Readout framework

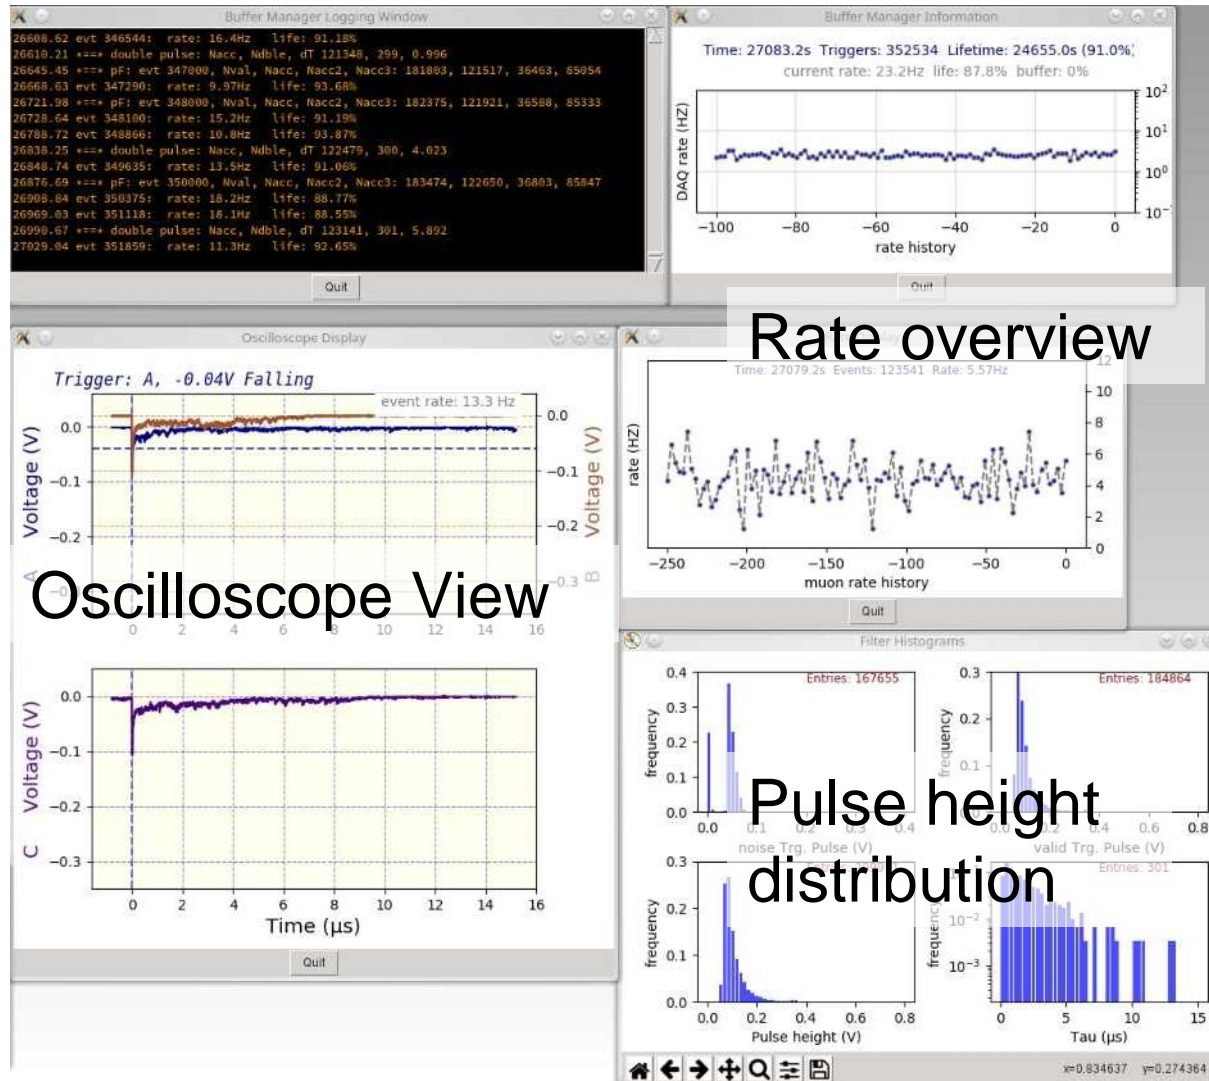

- Readout with an USB oscilloscope (PicoScope) and DAQ software at the computer (e.g. RaspberryPi)
- Implements the modern data taking approach with early stage digitization
- Concept of an oscilloscope is also well known to school students
no „black box“ DAQ
- Small setup with ‚cheap‘ components
- Flexible through own readout program

- Python framework developed by Günter Quast and Lars Vielsack (<https://github.com/GuenterQuast>)
- Implements a buffer manager and correlation function for trigger pulses with reference pulses
- Double pulse trigger possible

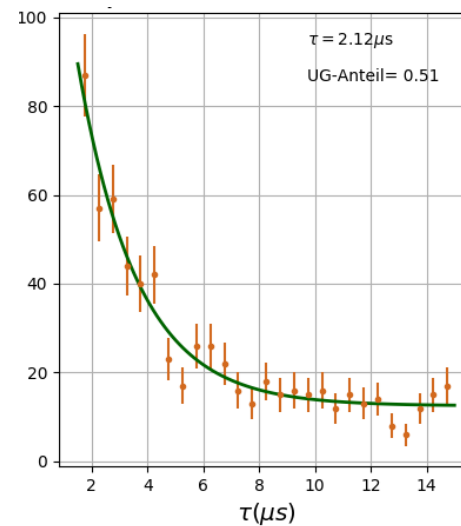

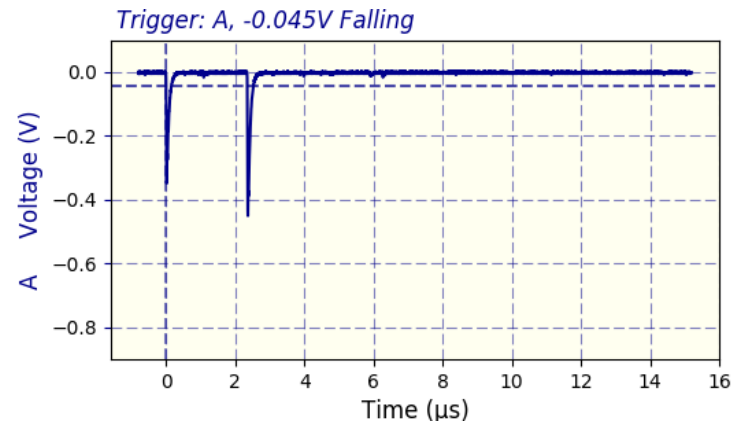

User interface

Example study

- Measurement of the muon life time with the Kamiokanne
- 20 days data taking
- $\tau = 2.1 \pm 0.3 \mu\text{s}$

Summary

- Cloud chamber as a cheap self build particle detector
- Water Cherenkov detector
Kamiokanne
- Custom python readout framework for USB oscilloscope
