✓ The Transition Radiation Tracker is one of the three sub-detectors of the ATLAS inner detector situated in the 2T magnetic field of the central solenoid.

✓ TRT is the outermost layer of the inner detector .

✓ TRT: 6.8 m in length and 2.2 m in diameter and weighs about 1500 kg .

✓ Provides tracking information for charged particles with:

$$*|\eta| < 2$$

$$*pT > 0.5\text{GeV}$$

✓ The TRT has two different geometrical arrangements of straws

- ▶ Barrel : Straws parallel to the beam axis
- ▶ End Cap : Straws perpendicular to the beam axis

- ▶ ❶ Introduce new gas types in the ATLAS simulation framework : Emulated Argon
- ▶ ❷ Mimic the HT response of the gas we wish to emulate : Argon
- ▶ ❸ Scale the TR absorption efficiency during the digitization by a TR efficiency reduction factor (TRERF)

The TRERF is determined by comparing the HT probability versus straw layer (SL) for the gases

Region	Argon TRERF
Barrel	0.05
End Caps	0.2

- ✓ Production and test of emulated sample with different TRERF for Barrel and End Cap
  - ✓ Electrons respond very well to emulation
  - ✓ The best TRERF were chosen by relying only on electron plots
- TRERF = 0.05 For Barrel & TRERF = 0.2 For End Caps
- ✓ Going to low TRERF lead to better agreement in electron and less for ROC curves
  - ✓ Results consistent in high occupancy

From each HT probability versus SL we calculate :

$$\chi = \frac{1}{n} \sum_{i=1}^{i=n} \frac{|P_{emul_i} - P_{mc_i}|}{P_{mc_i}} \quad (1)$$

$n$  : number of bins

$P_{emul}$  : pHTmb from Emulated samples

$P_{mc}$  : pHTmb from MC samples
