

Probing the Reionization Epoch with the Simons Observatory

First Biennial African Conference on Fundamental Physics and Applications, ACP 2018
Windhoek, Namibia

Ikape, Margaret

Dunlap Institute for Astronomy and Astrophysics,
University of Toronto, Canada.

29, June 2018

Simulation

Simulation

The major tasks of the simulation are:

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.
- Constructs reionization field from the density field.

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.
- Constructs reionization field from the density field.
- Generate a flat sky map or an all-sky map.

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.
- Constructs reionization field from the density field.
- Generate a flat sky map or an all-sky map.
- Generate the power spectrum of the map.

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.
- Constructs reionization field from the density field.
- Generate a flat sky map or an all-sky map.
- Generate the power spectrum of the map.

The parameters used in this model include:

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.
- Constructs reionization field from the density field.
- Generate a flat sky map or an all-sky map.
- Generate the power spectrum of the map.

The parameters used in this model include:

- The ionizing efficiency, ζ .

Simulation

The major tasks of the simulation are:

- Create an initial linear density field from initial conditions.
- Constructs reionization field from the density field.
- Generate a flat sky map or an all-sky map.
- Generate the power spectrum of the map.

The parameters used in this model include:

- The ionizing efficiency, ζ .
- The absorption system mean free path (also referred to as the ionizing photon mean free path), λ .

Simulation

- Generate the power spectrum of the map.

The parameters used in this model include:

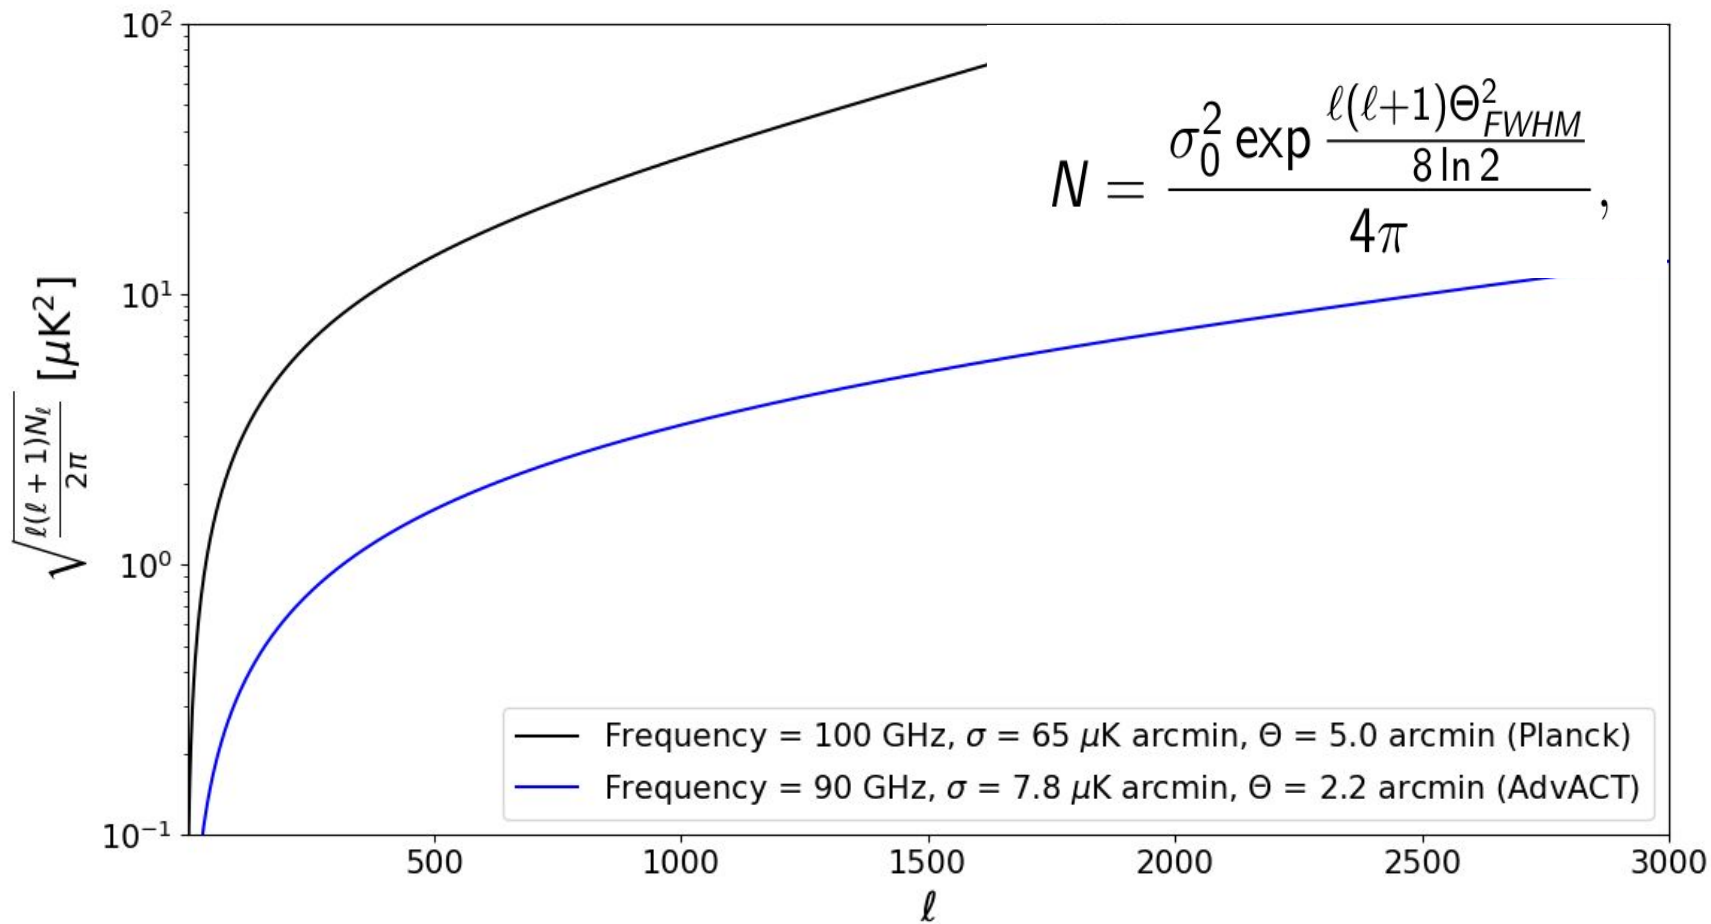

- The ionizing efficiency, ζ .
- The absorption system mean free path (also referred to as the ionizing photon mean free path), λ .
- The minimum halo mass of galaxies, M_{\min} , is the mass of the stars causing reionization.

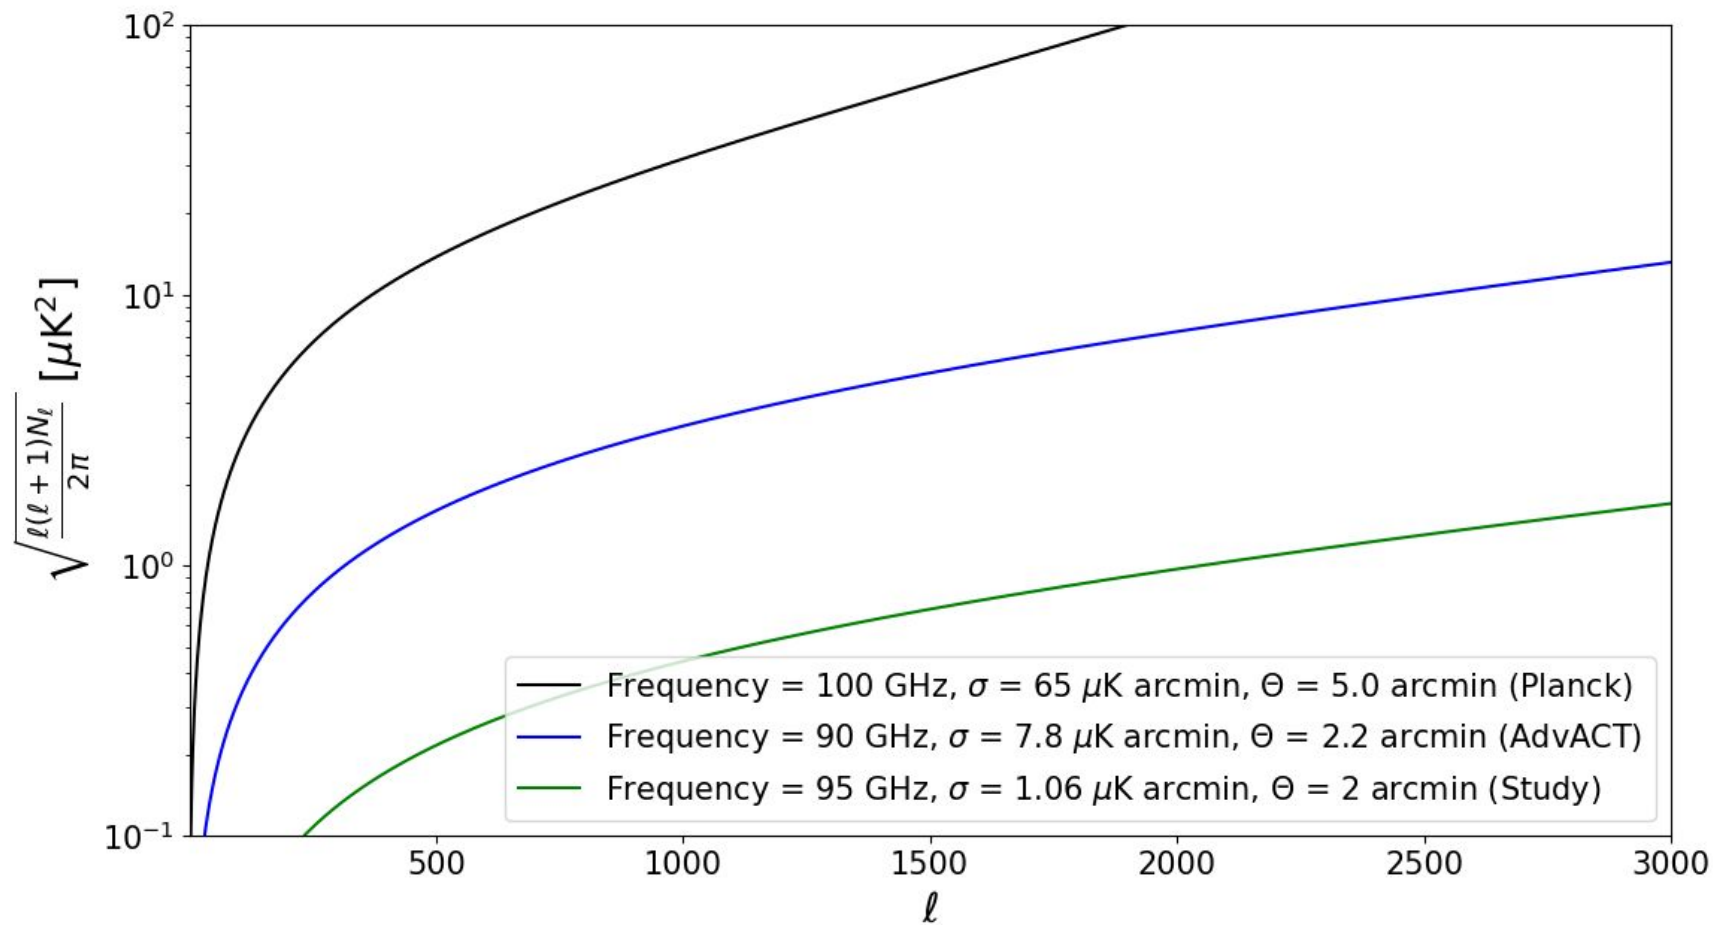

Simons Observatory

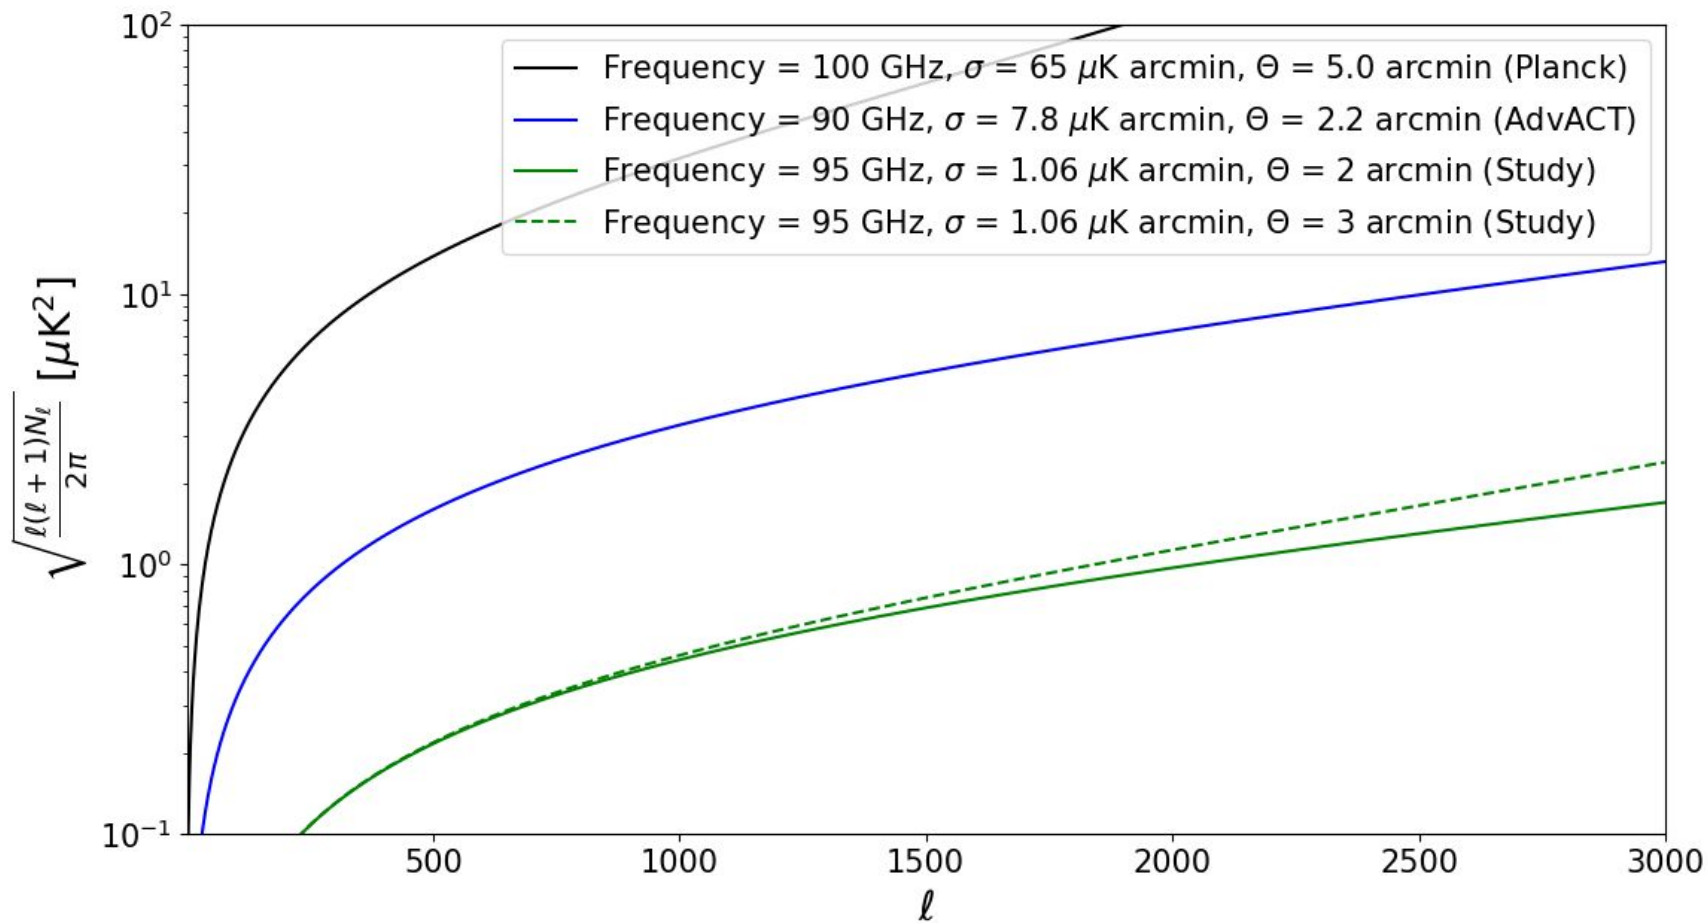

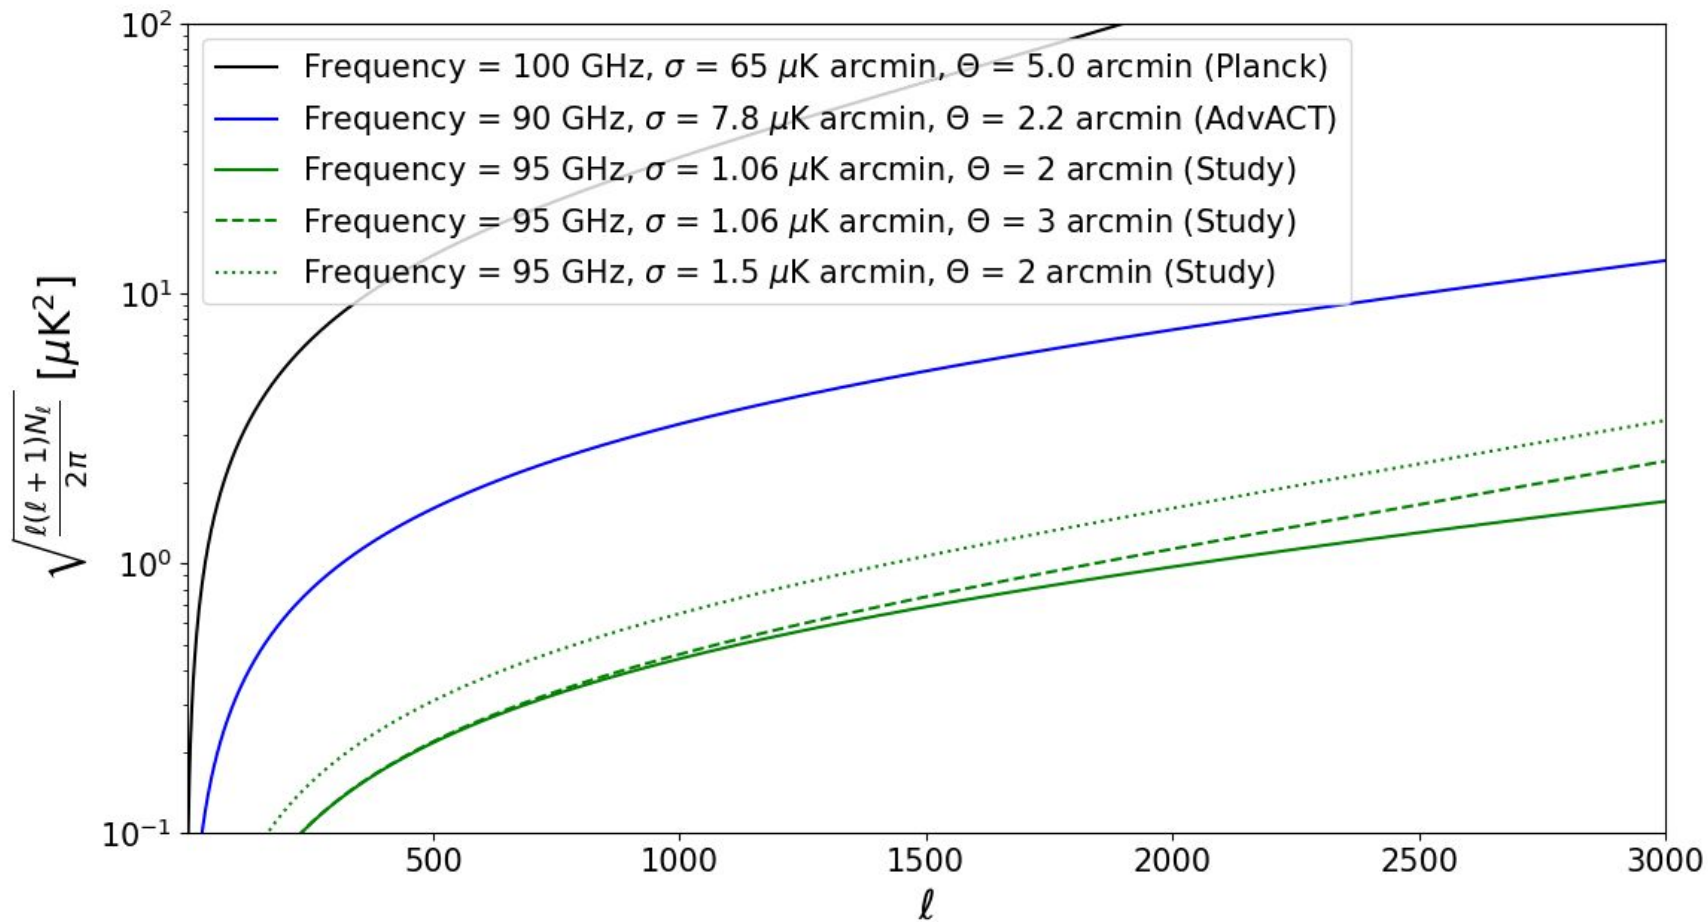

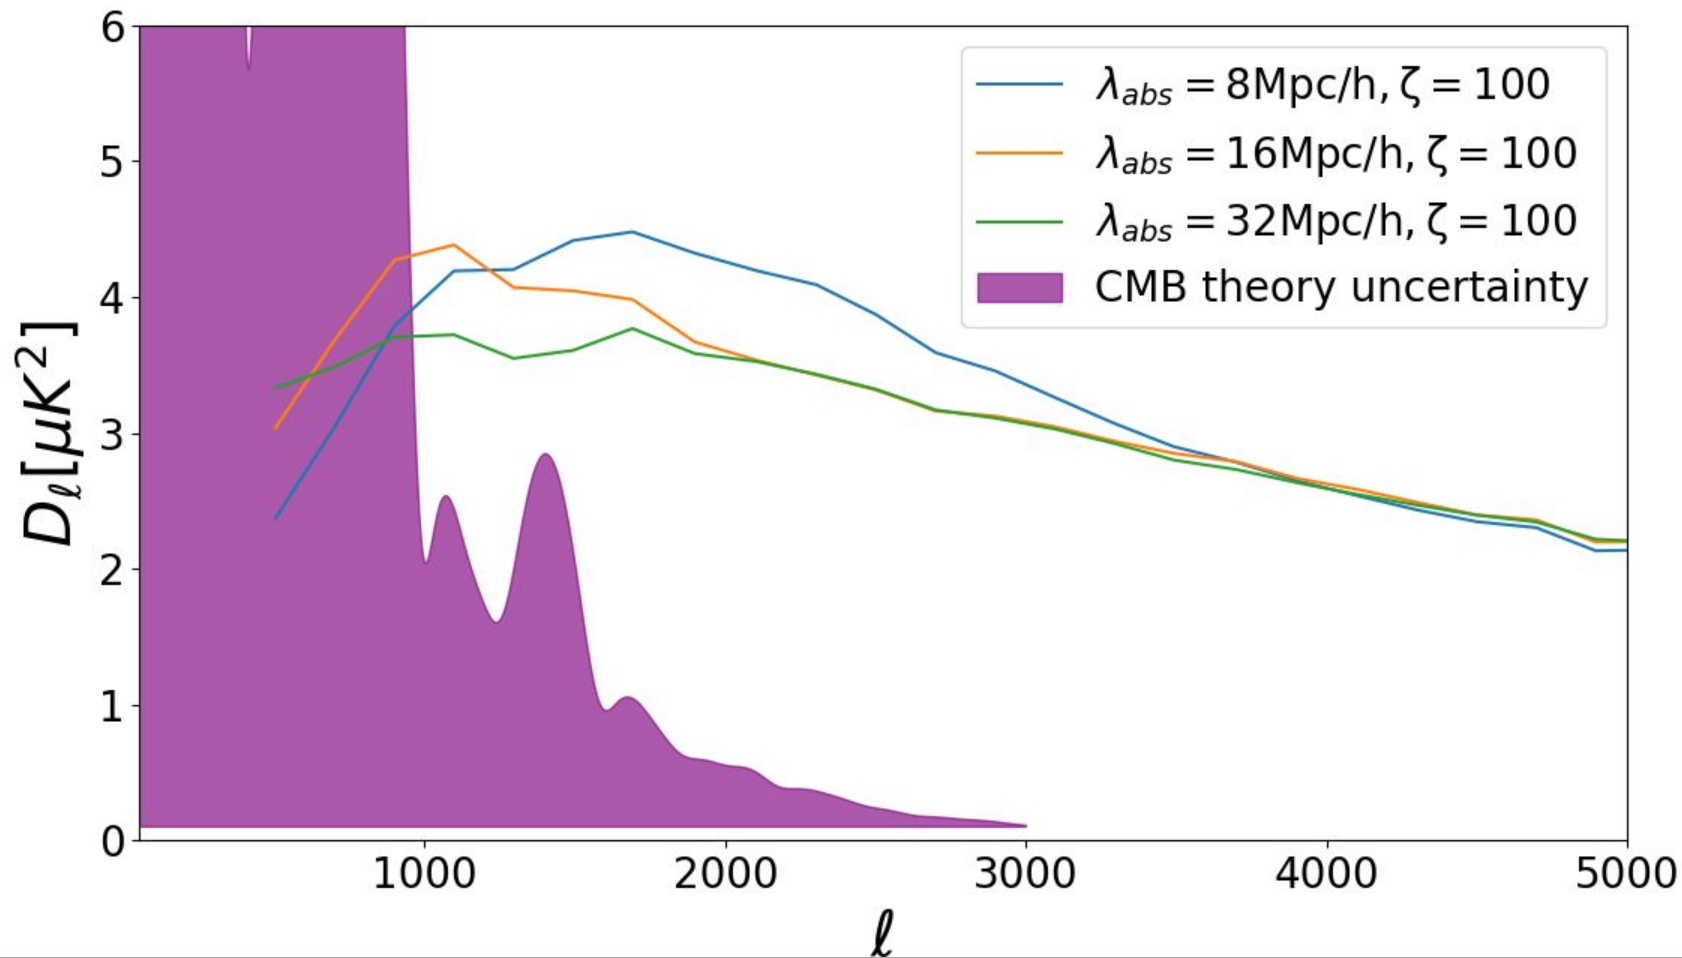

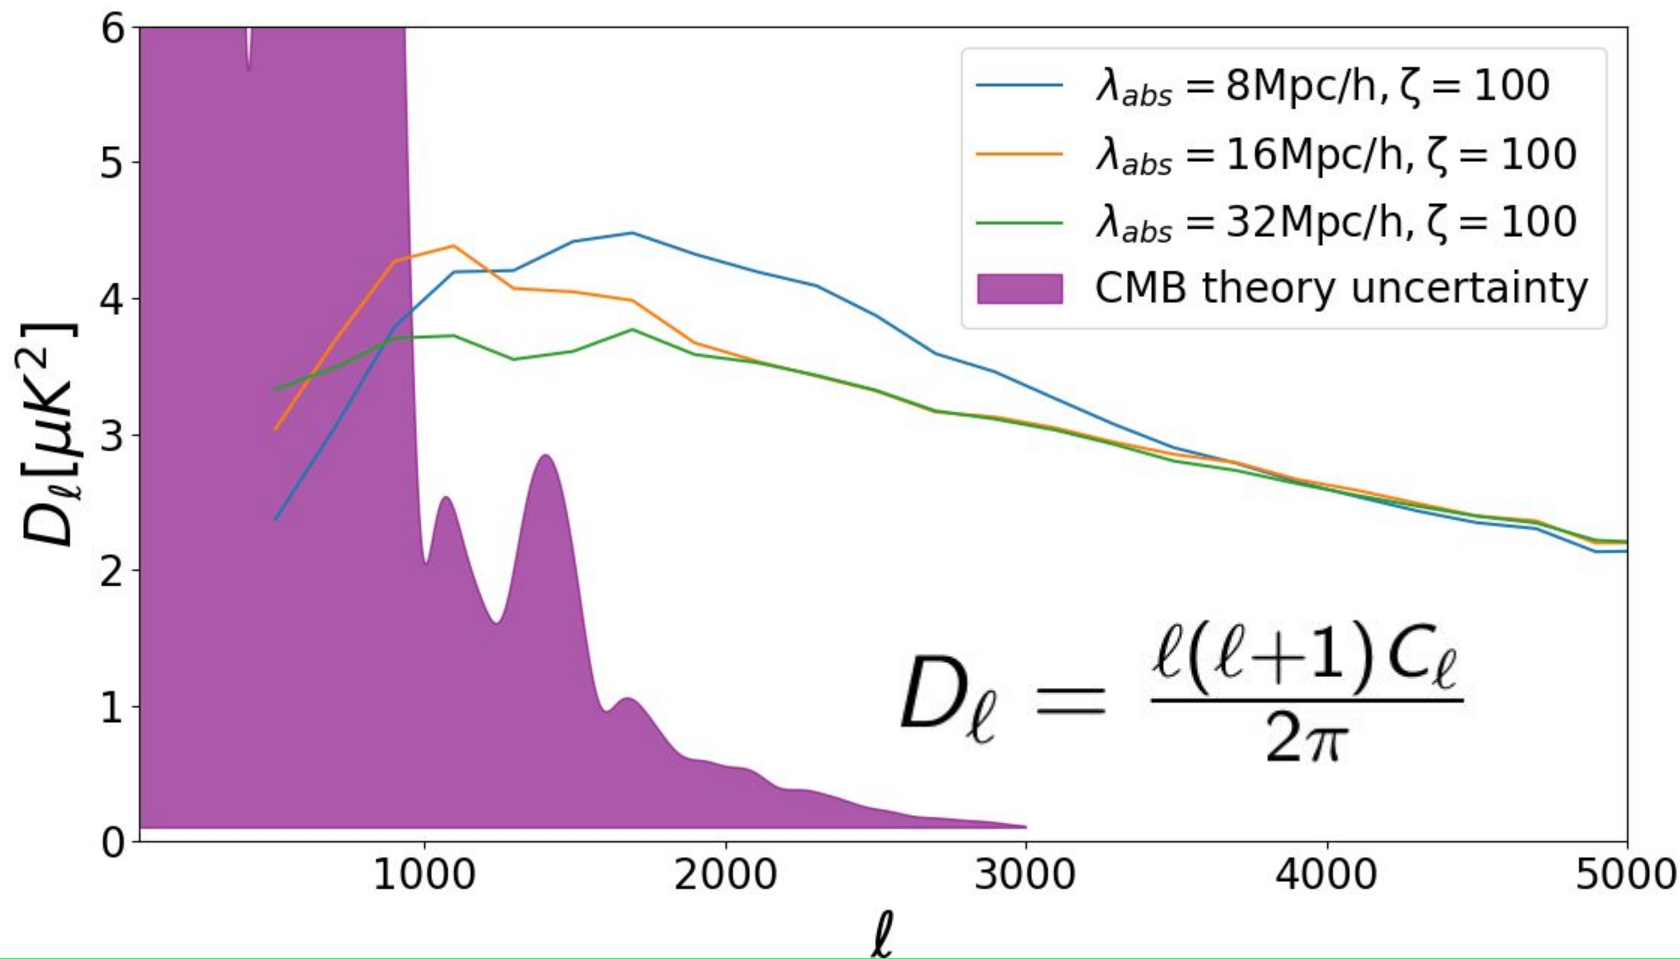

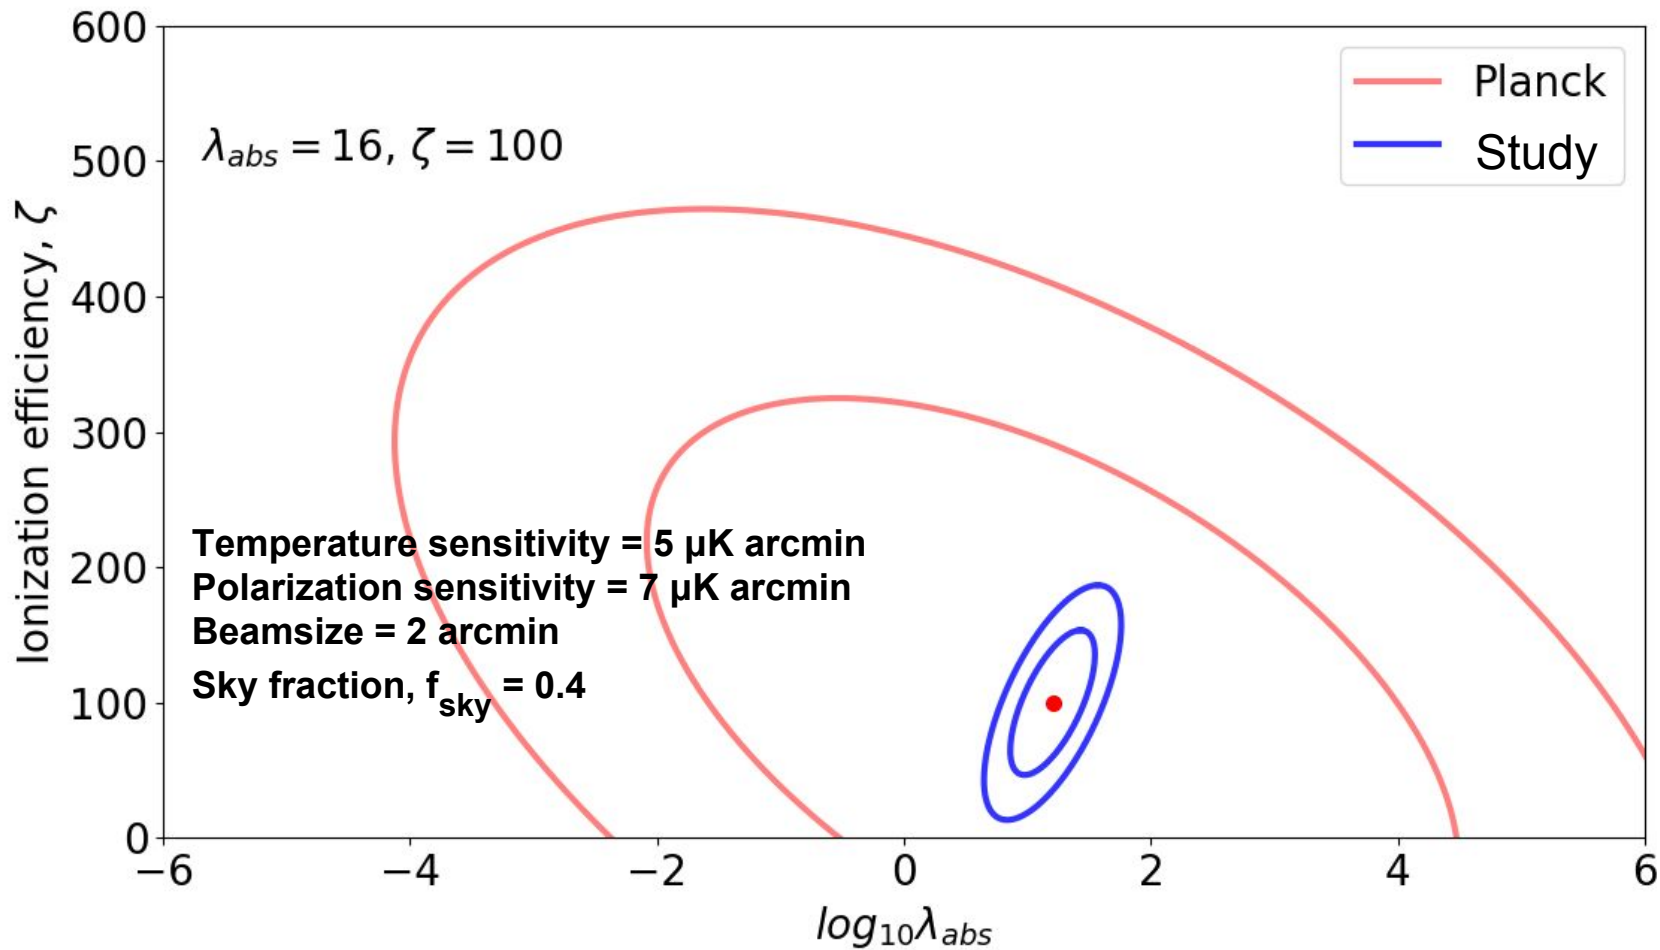

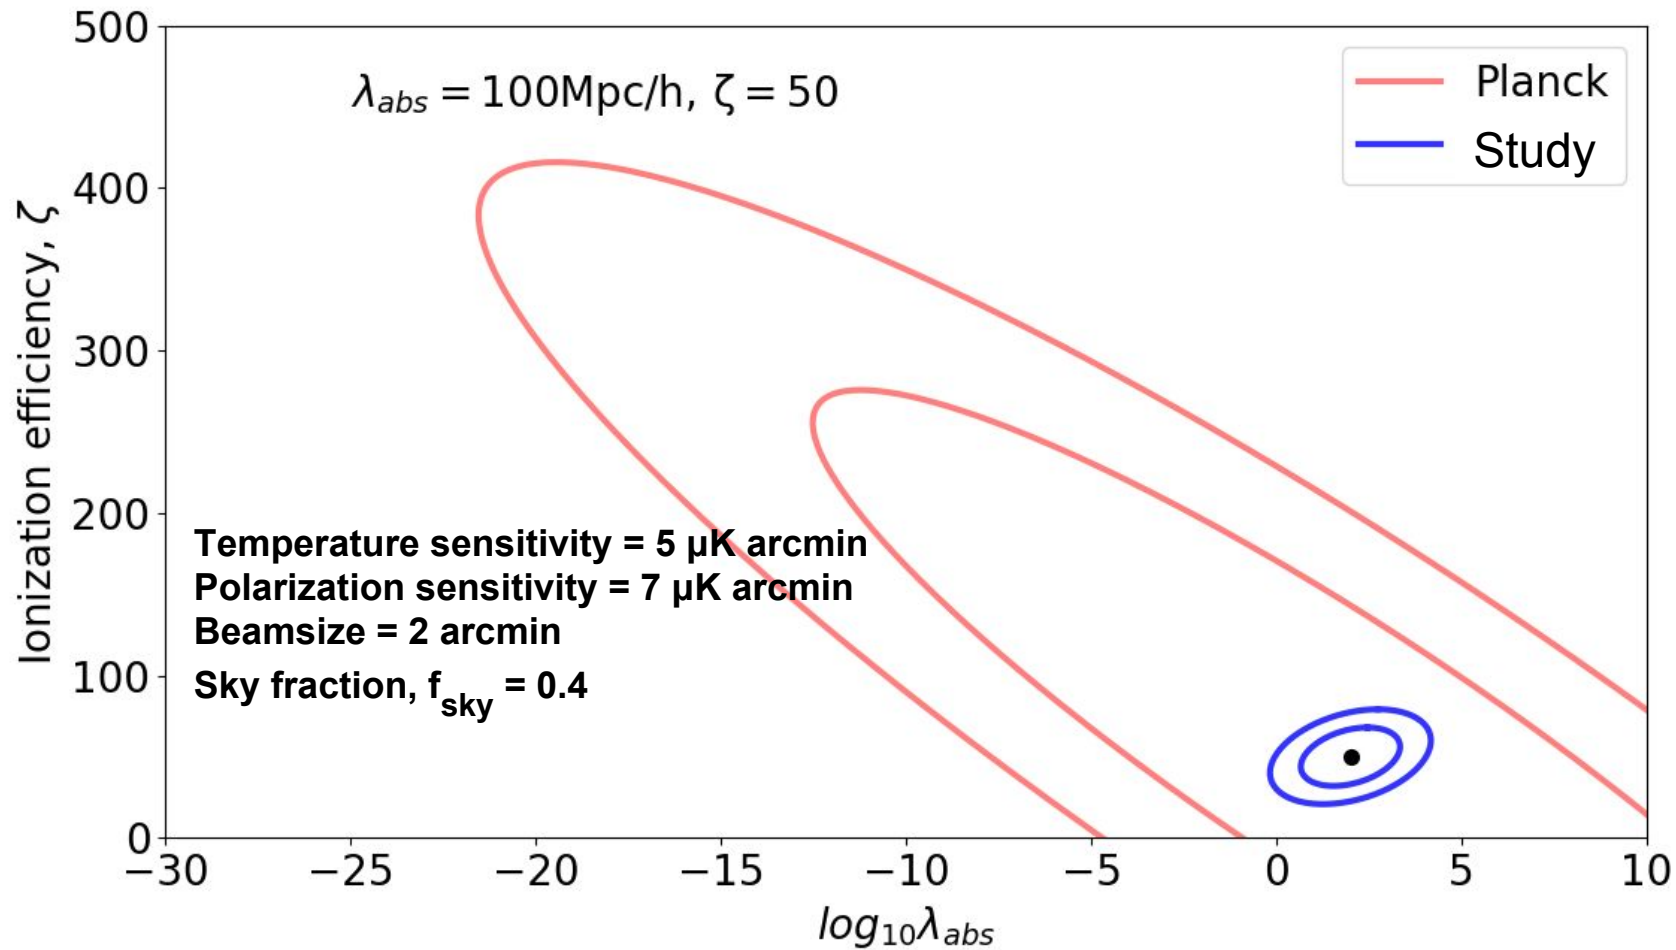

Conclusion

- The Simons Observatory is not in operation yet.
- Constraining cosmological parameters with simulated data from the Simons Observatory.
- Large f_{sky} , smaller beam-sizes, smaller noise will provide tighter constraints on parameters.
