⁴ IIAA, Huddersfield, UK

⁵ University of Manchester, Manchester, UK

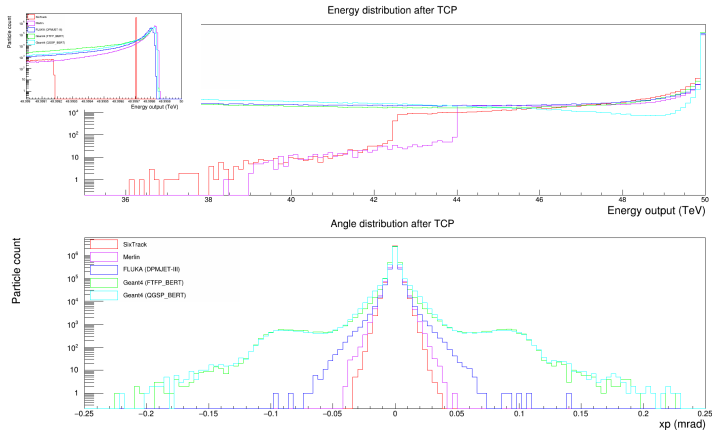

- Objective: Simulate and evaluate the FCC-hh collimation system.
 - The following talk is an overview of past work at LAL.
- 1 Update tools to work with the FCC - a lot of hard coded LHC values existed.
 - 2 Test tool physics at the FCC energy.
 - 3 Evaluate the performance of provided collimator optics and lattices.
 - 4 Suggest changes to enhance the system performance.

Collimation physics codes

- Collimation tools have been tested at LHC energies, but the FCC-hh is much higher.
- Are the models in the current codes used valid at the FCC-hh energy?
- Are differences in simulation codes due to tracking or due to physics?
- Implement different physics models directly into sixtrack to perform a comparison - therefore all use the same tracking.
- If all is good, all results will be the same.
- K2, and FLUKA were already added - have since added Merlin and Geant4 FTFP and QGSP.

See IPAC 2017 talk, "A Comparison of Interaction Physics for Proton Collimation Systems in Current Simulation Tools", (WEOBA1).

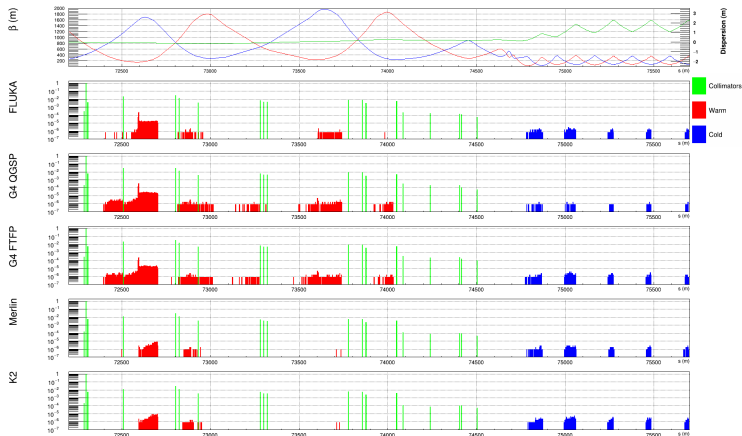

Codes comparison: Test collimator physics

Codes comparison: betatron loss map

Codes comparison: loss map - betatron collimation

Loss levels relative to K2

Region	Merlin	FLUKA	G4 FTFP	G4 QGSP
β TCP	1.00	1.01	0.92	0.94
β TCSG	1.00	1.27	1.45	1.32
β TCLA	0.92	1.50	2.37	1.91
β DS1	0.51	0.57	0.68	0.066
β DS2	0.44	0.45	0.52	0.032
β DS3	0.41	0.43	0.51	0.027
β DS4	0.41	0.45	0.47	0.086
δ TCP	0.45	1.39	1.12	0.69
δ TCSG	0.49	1.36	1.24	0.79
δ TCLA	0.51	1.3	1.22	0.92
Total	1	1.05	0.99	0.99

- Good agreement - losses are observed in similar locations, but differences occur in the quantity of losses at each peak.
- Exclude codes that are clearly incorrect - will not use K2 or G4 GQSP.

Dispersion suppressor collimators

- The collimation system has been taken as a scaling from the LHC.
- Following loss map uses the Berlin/IPAC lattice.
- DS collimators are in and enabled.
- TCP - 18.06σ , TCSG 21.67σ , TCLA 24.08σ , TCLD 35.14σ .
- 6.4 million protons, fixed $dp = -0.0015$. Tracking starts at IPA, 200 turns.
- TCP is at $dp \approx 0.001$.

Energy loss map - full ring

Energy collimation insertion

Energy loss map - IPG

Betatron loss map - energy collimation insertion

Injection

Energy collimation summary

- Is the lattice fully corrected (chromatically)?
- The current collimator jaws are placed in the unstable region of the longitudinal phase space.
- These should be placed closer - but much closer could cause the system to interact with the betatron collimators.
- Possibly should switch to the alternate energy collimation layout with higher normalized dispersion.
- Move the energy collimation dispersion suppressor collimators back a cell - currently they do not function sufficiently well.
- Care required with energy loss into the IR - perhaps extra TCT collimators are required?
