

# Hunting All the Hidden Photons

*Thursday 5 April 2018 15:15 (15 minutes)*

We explore the full constraining power of experimental bounds derived for hidden photons by applying them to gauge bosons of a weakly coupled  $U(1)_{B-L}$ ,  $U(1)_{L_\mu-L_\tau}$ ,  $U(1)_{L_\mu-L_e}$  and  $U(1)_{L_\tau-L_e}$ . The associated gauge bosons of these anomaly-free groups are well-motivated mediators to a dark sector. In contrast to a hidden photon that acquires universal couplings to charged SM particles through kinetic mixing with the photon, several SM particles are uncharged under these gauge groups. Also taking into account loop-induced kinetic mixing the hidden photon bounds are drastically altered for the different gauge groups. We also discuss cosmological constraints and the sensitivity of future experiments.
