Instrumentation brain-storming

R. De Maria

WP2 meeting
Today the machine is sufficiently reproducible not to need an orbit feedback at the IP. For HL-LHC it might not be the case for the lowest value of $\beta^*$ possible.

\[ X_{\text{measured}}(t) = X_{\text{true}}(t) + O_{\text{error}}(t, I_b, \ldots) \]

\[ \text{Std}(X_{\text{error}}(t, I_b, \ldots)) < 2 \mu m \] when

- sampled at 10 Hz for the 36000 consecutive samples (10 hours)
- $0.5 \times 10^{11} < I_b < 2.2 \times 10^{11}$, $|X_{\text{true}}| < 15$ mm
- samples should be delivered to the feedback DSP within 20 ms delay
AC Dipole optics measurement

Today amplitude data from AC dipole measurements is not sufficiently accurate to measure $\beta$-function in the Q1-Q4 areas as compared with K-modulation. Amplitude data would allow much faster optics measurements if available.

$$\text{DFT}(X_{\text{measured}}(t), \omega) = S_{\text{error}}(\omega, I_b, <X>, ...) \text{ DFT}(X_{\text{true}}(t), \omega)$$

$$|S_{\text{error}}(\omega, I_b, <X>, ...,)-1|<0.02 \text{ and}$$

$$\text{phase}(S_{\text{error}}(\omega, I_b, <X>, ...))<0.0001$$

- 16384 sample turn by turn samples for:
- $0.8 \times 10^{10} < I_b < 1.2 \times 10^{10}$, $|X_{\text{true}}| < 15$ m
- $0.1 < \omega < 0.4$
- Few single bunches
