

## Status of the ITS O2 code

- **ITS detector geometry**
- **Simulations:** Transport, ALPIDE response, digitization
- **Reconstruction:** Cluster finding, cluster-topology code, track finding (see Maximiliano's slides)
- **Quality Control & event display**
- **Calibration & alignment**

# Layout of the upgraded ITS

12.6 G-pixel camera  
(~10 m<sup>2</sup> of Si, ~13.6M CHF)

$\eta$  coverage:  $|\eta| < 1.22$   
(for 90% of luminous region)

R coverage:  
22 – 400 mm

**ALPIDE:** solution for ITS&MFT

Readout time:  $\leq 2\mu\text{s}$

Chip size: 15 x 30 mm

Pixel size: 29 x 27  $\mu\text{m}^2$

Number of pixels : 512 x 1024

7 layers of MAPS  
(Monolithic Active Pixel Sensor)

# End-of-2017 view on the ITS code

## ● Geometry:

- ◆ Operational
- ◆ Remaining details and changes in the HW design being implemented
- ◆ Alignable volumes coming this year (will be the same as in AliRoot)

Next year: Sagging degrees of freedom, services outside the physics acceptance

## ● Simulation:

- ◆ “Box” particle generator
- ◆ MC transport with Geant3
- ◆ ALPIDE response using the output of external “microscopic” chip simulations
- ◆ Time-aware digitization: triggered and continuous mode  
(to be finalised: strobe boundaries, access to the params in CDB)

Next year: Try also (multi-threaded) Geant4 ?

Synchronization with other detectors in continuous mode ?

# End-of-2017 view on the ITS code

## ● Reconstruction:

- ◆ Cluster finder (the same for the MC and real data)
- ◆ Code to handle the cluster shapes (being ported from AliRoot)
- ◆ Track finders
  - CookedTracker (“classical”, CPU) : functional, reasonably fast, multi-threaded
  - CATracker (“Cellular Automaton”, CPU and GPU) : see Max’s presentation
- ◆ MC labels decoupled from clusters and tracks, written to a separate branch, can optionally be suppressed

Next year: Development of the CATracker, cluster compression, Cluster class based on shapeID and external LUT, wrapping the reconstruction code in “O2 devices”

## ● Quality Control & Event Display:

- ◆ An initial estimate of the ITS QC requirements sent to the O2 WP7
- ◆ A simplified representation of the ITS geometry for the Event Display provided to the O2 WP9

Next year: All the rest

## ● Calibration and alignment:

Next year: Everything

# Tasks & Manpower

| 1  | Task                       | Contact            | People                   | When     |
|----|----------------------------|--------------------|--------------------------|----------|
| 2  | General ITS geometry       | Mario Sitta        | Parinya                  | --> 2017 |
| 3  | Sagging geometry           | Cristina Bedda     | Mario, Ruben             | 2018     |
| 4  |                            |                    |                          |          |
| 5  | ALPIDE simulation          | Davide Pagano      | Stefano, Germano, Enrico | --> 2017 |
| 6  | Time dependent digitiser   | Ruben Shahoyan     |                          | 2017     |
| 7  |                            |                    |                          |          |
| 8  | Time dependent clusteriser | Ruben Shahoyan     |                          | 2017     |
| 9  | Cluster finder (CPU)       | Iouri Belikov      |                          | 2017     |
| 10 | Cluster finder (FPGA) ?    | Anisa Qazi ?       |                          |          |
| 11 | Cluster topology           | Luca Barioglio     |                          | 2017 --> |
| 12 |                            |                    |                          |          |
| 13 | CA tracker (CPU, GPU)      | Maximiliano Puccio |                          | 2017 --> |
| 14 | CA tracker (GPU)           | Iacopo Colonnelli  |                          | 2017 --> |
| 15 |                            |                    |                          |          |
| 16 | Primary vertex finder      | Matteo Concas      |                          | 2018     |
| 17 |                            |                    |                          |          |
| 18 | Compression of clusters    |                    |                          | 2018     |
| 19 |                            |                    |                          |          |
| 20 | Calibration (noise, dead)  |                    |                          | 2018     |
| 21 | QC & event display         |                    |                          | 2018     |
| 22 |                            |                    |                          |          |
| 23 | O2 "devices"               |                    |                          | 2018     |

- 5 – 7 active developers (~50 people on the mailing list)
- New young people expressing an interest to join
  - ◆ Tsukuba, Japan (Kana Nakagawa)
  - ◆ Prague, Czech Republic (Artem Isakov)

# Supporting slides

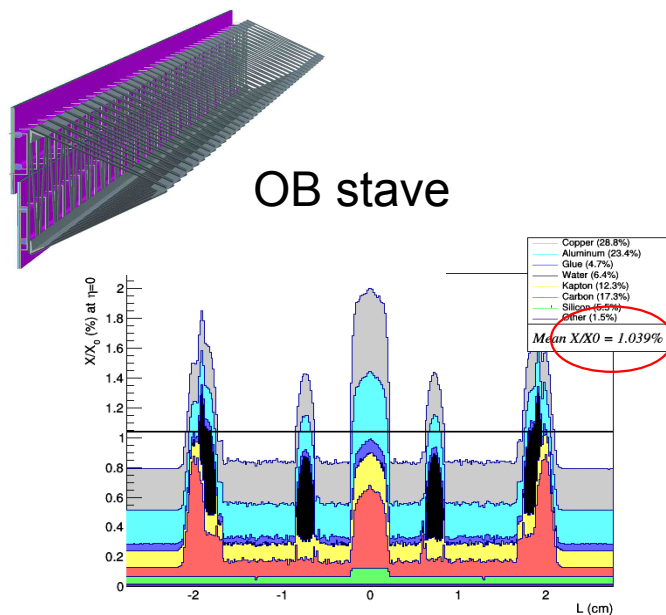

# ITS geometry for full simulation & reconstruction (Mario)

IB stave

OB stave

Very detailed and close to the final state.  
But, no alignment yet.

# Updates in the ITS geometry

(Mario)

## New IB Cross Section

Antonello, 5 Oct 17

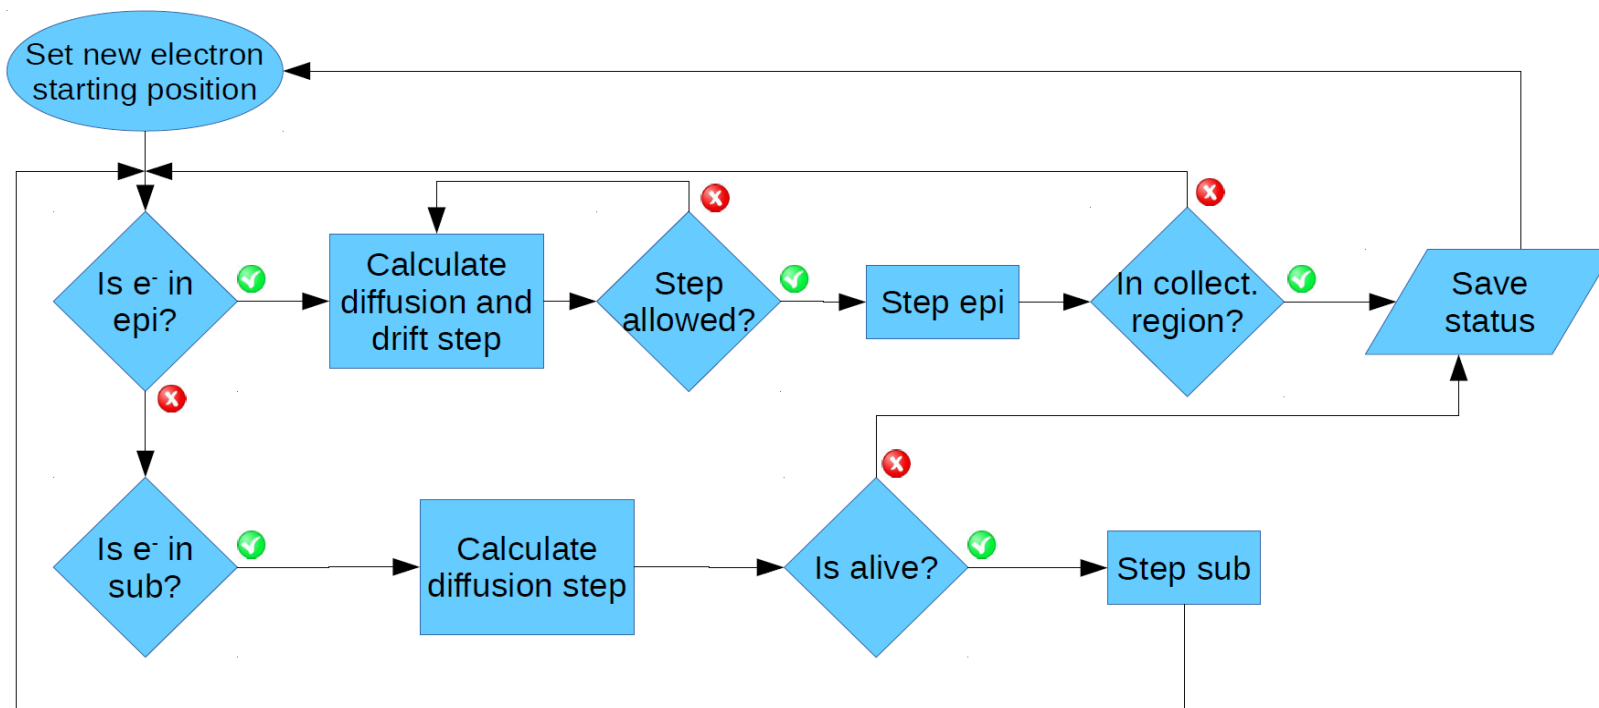

# ALPIDE response

( Miljenko Šuljić, Jacobus W. van Hoorne )

## Algorithm

31/05/17

MAPS simulation - Miljenko Šuljić

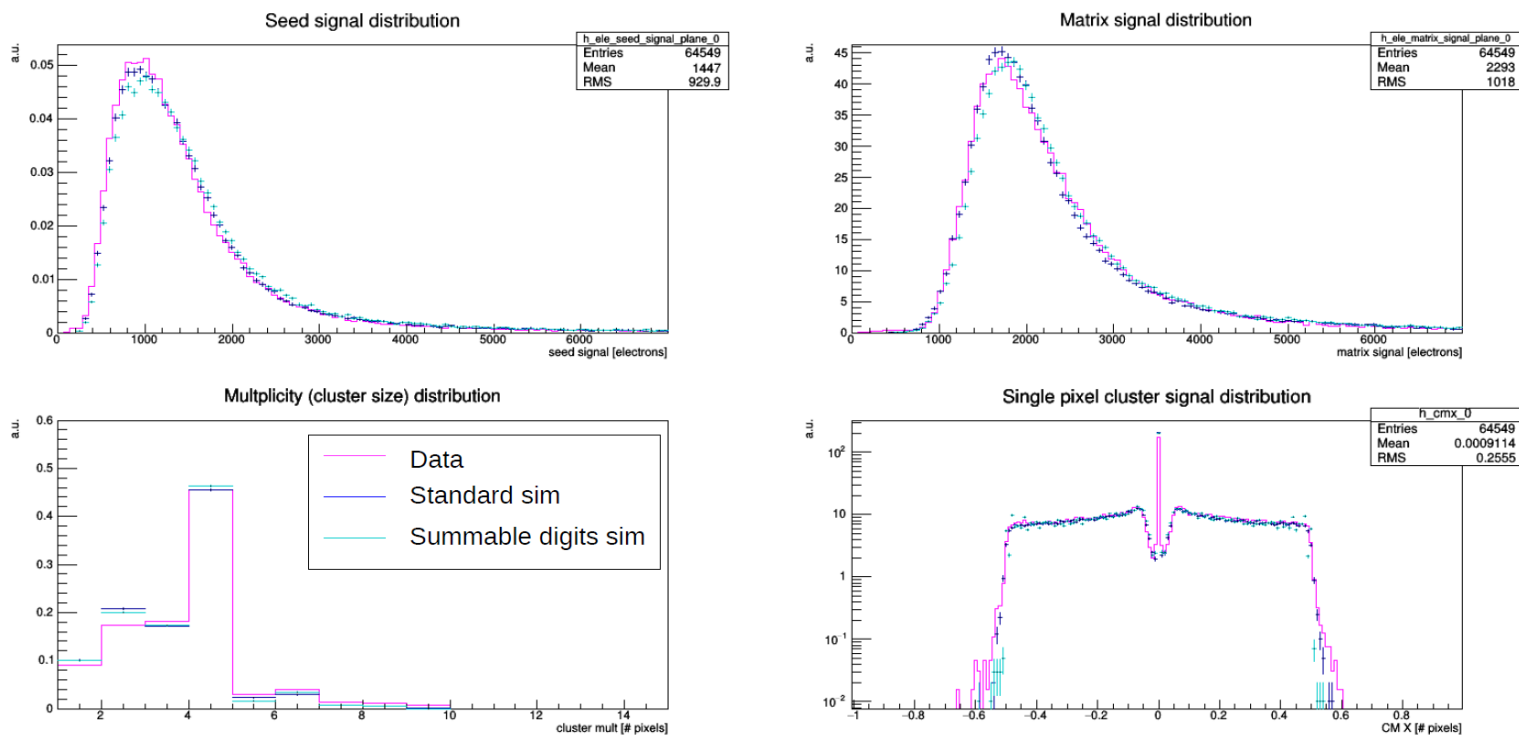

13

“Microscopic” simulations using the electrical field extracted from TCAD

# ALPIDE response compared with data

( Miljenko Šuljić, Jacobus W. van Hoorne )

MIP - 25 um epi, -3 V<sub>bb</sub>, Investigator

16/06/17

Summable digits simulation - Miljenko Šuljić

5

The agreement of both “microscopic” and “on-grid” simulations with the data is just amazing !

# Time-aware ITS digitization

( Ruben )

At the end, we want to be able to generate the data in TimeFrame format

# Porting the cluster-topology code

(Luca Barioglio)

Number of clusters: 20295

| Topology  | counts | Topology  | counts | Topology  | counts |
|---|--------|---|--------|---|--------|
|  | 14106  |  | 35     |  | 6      |
|  | 1793   |  | 11     |  | 6      |
|  | 1631   |  | 8      |  | 5      |
|  | 1254   |  | 7      |  | 5      |

Offline

# Tracking time vs the level of noise (Iouri)

Number of fake hits:  $12.6 \times 10^9 \times 10^{-5} = 1.26 \times 10^5$  (compare:  $dN/dy \sim 2000$  for central PbPb)

“Cooked Matrix” tracker:

- Noise “hit rate”  $10^{-5}$  : **real time 23 s/ev** (4 threads on 4-core 2.66 GHz CPU)
- Noise “hit rate”  $10^{-6}$  : **real time 1.5 s/ev** (4 threads on 4-core 2.66 GHz CPU)

(Compare: the interaction rate is 50 kHz)

# Tracking time vs # of threads (louri)

- 2011 mac, 2 GHz Intel Core i7
  - ◆ 4 cores, 8 threads
- 4000 pions in  $|\eta| < 0.9$ 
  - ◆  $0.2 < p_T < 2.0$  GeV/c, flat
  - ◆ No noise
  - ◆ Constant 0.5 T mag. field

**C++11 multi-threading works !**

Linux/gcc and macOS/clang

( bottle neck of the moment – cluster sorting )

# Comparison with MC (louri)

basic but functional

- Average tracking efficiency (7-cluster tracks):

Event 0/10

Good found tracks: 2897, efficiency: 0.869187

Event 1/10

Good found tracks: 2888, efficiency: 0.866487

...

- “rec – gen” plots (integrated over  $p_T$ ) :

# Upgraded ITS in AliEve

An event with 35 MC and 29+4 reconstructed vertices (ITSU stand-alone, Pythia6 @ 14 TeV)

- The ITS stand-alone primary tracks are easily associated with prim.vertices separated by  $> 1$  mm.
- The TPC+ITS primary tracks are even easier:  $1\text{mm}/v_{\text{drift}} \sim 40\text{ns}$  associated with FIT time-stamp
- The secondary tracks are challenging
