

# *Effective Field Theory analysis at high energy*

**Marc Riembau**

**IFAE / DESY**

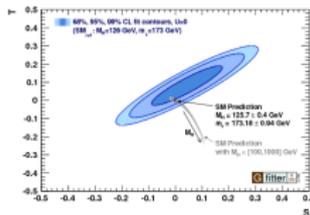

**27 March 2018**

Where to go? No guaranteed path.

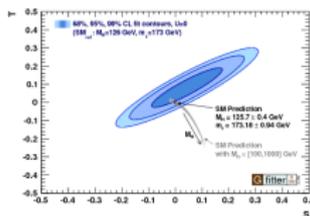

A mandatory program to pursue is to **stress-test the SM**.

Very useful program at LEP, told us that the mass and interaction eigenstates of the EW bosons are aligned to a high degree.

Where to go? No guaranteed path.

A mandatory program to pursue is to **stress-test the SM**.

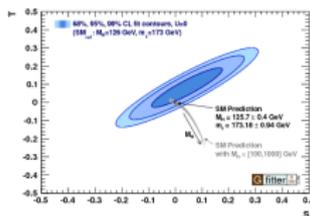

Very useful program at LEP, told us that the mass and interaction eigenstates of the EW bosons are aligned to a high degree.

LEP precision  $\sim 10^{-3}$ .

LHC precision  $\sim 10^{-1}$ .

LEP precision  $\sim 10^{-3}$ .

LHC precision  $\sim 10^{-1}$ .

However, "Energy helps accuracy"

Farina et.al.'16

## High energy enhancement: a proof of concept

$$\mathcal{M}_\gamma = -i \frac{e^2 \sin \theta}{2m_W^2} s Q_f$$

$$\mathcal{M}_Z = -i \frac{e^2 \sin \theta}{2m_W^2} \frac{s}{s_W^2} (T_f^3 - s_W^2 Q_f)$$

$$\mathcal{M}_t = +i \frac{e^2 \sin \theta}{2m_W^2} \frac{s}{2s_W^2}$$

Sum does not grow with energy, as expected.

However, it is obvious that a generic deviation from the SM relation will be **amplified at large energies**.

-If a deformation gets enhanced at high energy

$$\sigma \sim \sigma_{SM} (1 + c E^2/\Lambda^2)$$

0.1% precision at  $E \sim 100\text{GeV}$   $\leftrightarrow$  10% precision at  $E \sim 1\text{TeV}$

-If a deformation gets **enhanced at high energy**

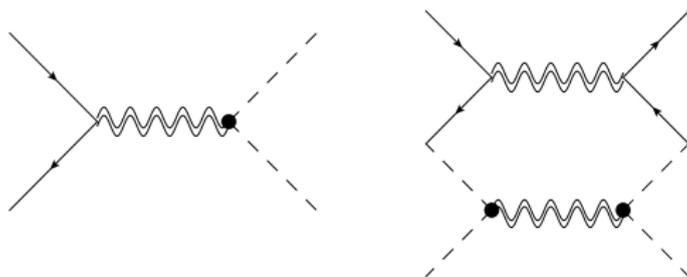

$$\sigma \sim \sigma_{SM} (1 + c E^2/\Lambda^2)$$

0.1% precision at  $E \sim 100\text{GeV}$   $\leftrightarrow$  10% precision at  $E \sim 1\text{TeV}$

$\sim 1\%$  precision at  $E \sim 30\text{TeV}$   $\leftrightarrow$   $10^{-5} - 10^{-6}$  precision at  $E \sim 100\text{GeV}$ .

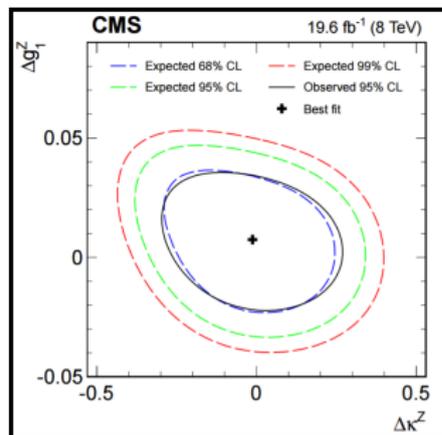

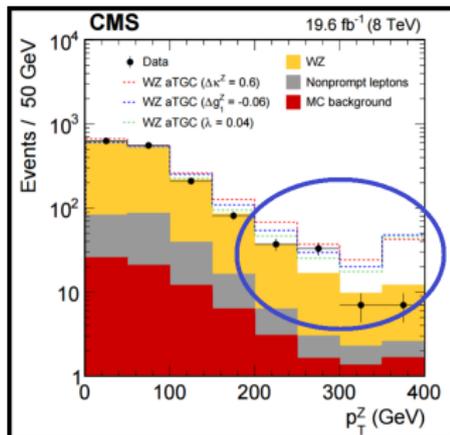

A 30TeV lepton collider will allow to test the SM to extreme levels.

The SM is unique at  $d = 4$ , so deformations away from the SM cannot be arbitrary, they are organized in dimension six operators, which encode the low energy remnants of higher energy physics.

$$\mathcal{L} = \frac{c_{Hf}}{\Lambda^2} (\bar{f} \gamma_\mu f) (H^\dagger \overleftrightarrow{D}_\mu H) + \frac{c_{4f}}{\Lambda^2} (\bar{f} \gamma_\mu f) (\bar{f} \gamma_\mu f) + \frac{c_H}{\Lambda^2} (H^\dagger D_\mu H) (H^\dagger D_\mu H) + \frac{1}{\Lambda^4} \mathcal{O}^{(8)} + \frac{1}{\Lambda^6} \mathcal{O}^{(10)} + \dots$$

# LHC diboson analyses

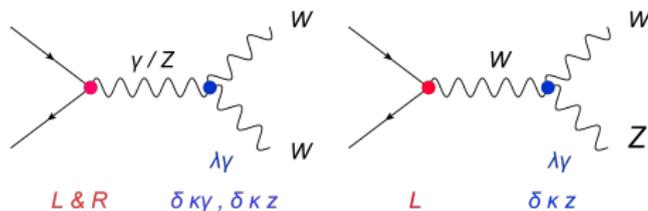

$$\text{LEP2} : \delta g_1^Z = 0.051 \pm 0.031, \quad \delta\kappa_\gamma = -0.067 \pm 0.061, \quad \lambda_\gamma = -0.067 \pm 0.036$$

$$\text{LHC} : \delta g_1^Z = 0.010 \pm 0.008, \quad \delta\kappa_\gamma = 0.017 \pm 0.028, \quad \lambda_\gamma = 0.0029 \pm 0.0057$$

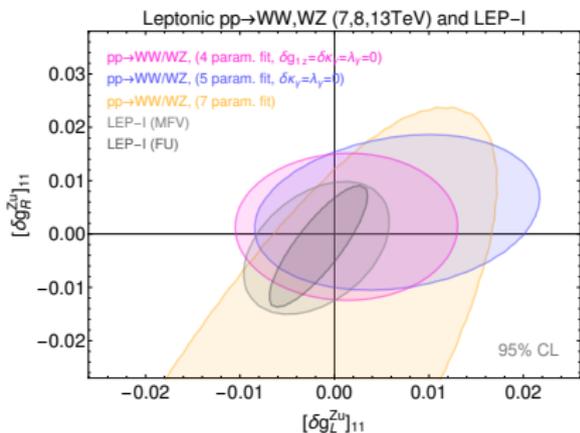

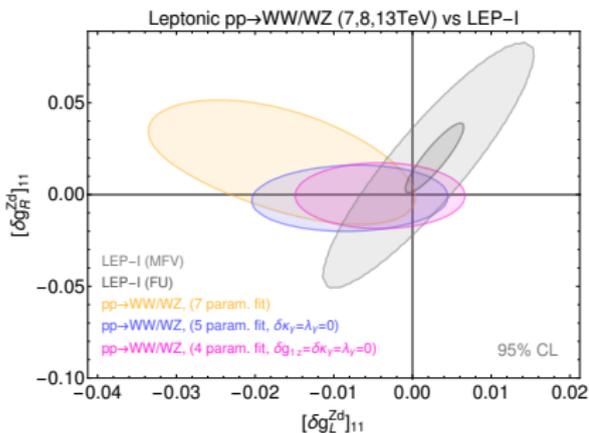

LHC already surpasses LEP in setting constraints to anomalous couplings among electroweak gauge bosons.

# Light quark - electroweak anomalous couplings

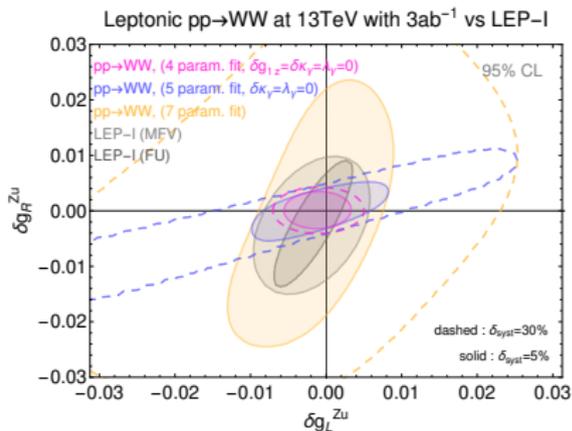

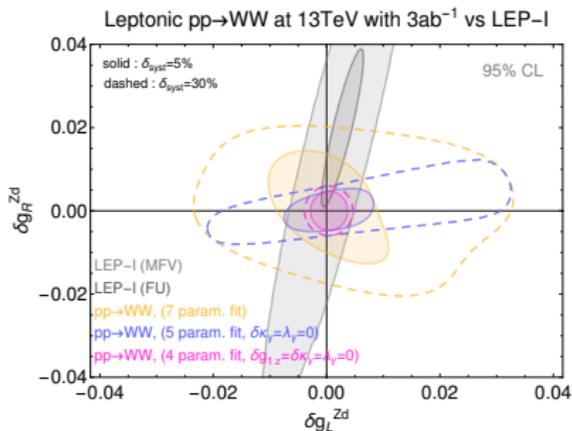

$$\begin{aligned}
 \mathcal{L}_{V\bar{q}q} = & \sqrt{g^2 + g'^2} Z_\mu \left[ \sum_{f \in u, d} \bar{f}_L \gamma_\mu \left( T_f^3 - s_\theta^2 Q_f + \delta g_L^{Zf} \right) f_L \right. \\
 & \left. + \sum_{f \in u, d} \bar{f}_R \gamma_\mu \left( -s_\theta^2 Q_f + \delta g_R^{Zf} \right) f_R \right] \\
 & + \frac{g}{\sqrt{2}} \left( W_\mu^+ \bar{u}_L \gamma_\mu \left( I_3 + \delta g_L^{Wq} \right) d_L + \text{h.c.} \right) .
 \end{aligned}$$

# Light quark - electroweak anomalous couplings

And already offers a better probe of some anomalous couplings among light quarks and electroweak gauge bosons.

# Light quark - electroweak anomalous couplings

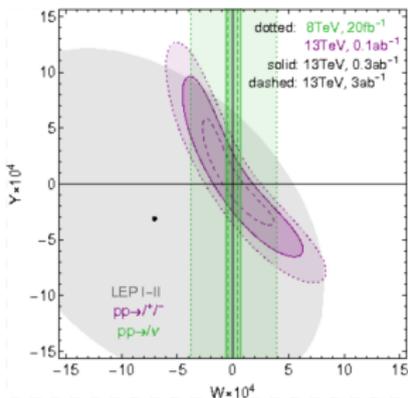

Single channel for diboson at HL-LHC will push LEP constraints for MFV and FU schemes.

## Oblique parameters

The two point function  $\Pi_{ij}(p)$  of  $V_i = (W^1, W^2, W^3, B)$  gets corrections from  $S, T, W, Y$

$$\delta\Pi_{ij} = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & T & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \left(\frac{p}{m_W}\right)^0 + \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & S \\ 0 & 0 & S & 0 \end{pmatrix} \left(\frac{p}{m_W}\right)^2 + \begin{pmatrix} W & 0 & 0 & 0 \\ 0 & W & 0 & 0 \\ 0 & 0 & W & 0 \\ 0 & 0 & 0 & Y \end{pmatrix} \left(\frac{p}{m_W}\right)^4$$

$$\begin{pmatrix} A_\mu \\ Z_\mu \end{pmatrix} = \begin{pmatrix} \frac{1}{q^2} - \frac{t_W^2 W+Y}{m_Z^2} & \frac{t_W(Y+T)c_W^2 + s_W^2 W-S}{(c_W^2 - s_W^2)(q^2 - m_Z^2)} + \frac{t_W(Y-W)}{m_Z^2} \\ * & \frac{1+T-W-t_W^2 Y}{q^2 - m_Z^2} - \frac{t_W^2 Y+Z}{m_Z^2} \end{pmatrix} \begin{pmatrix} A_\mu \\ Z_\mu \end{pmatrix}$$

Farina et.al.'16

## Oblique parameters

S and T do not deform Drell-Yan in a way that increases at high energy, but they deform the production of ( the longitudinal polarizations of ) diboson,

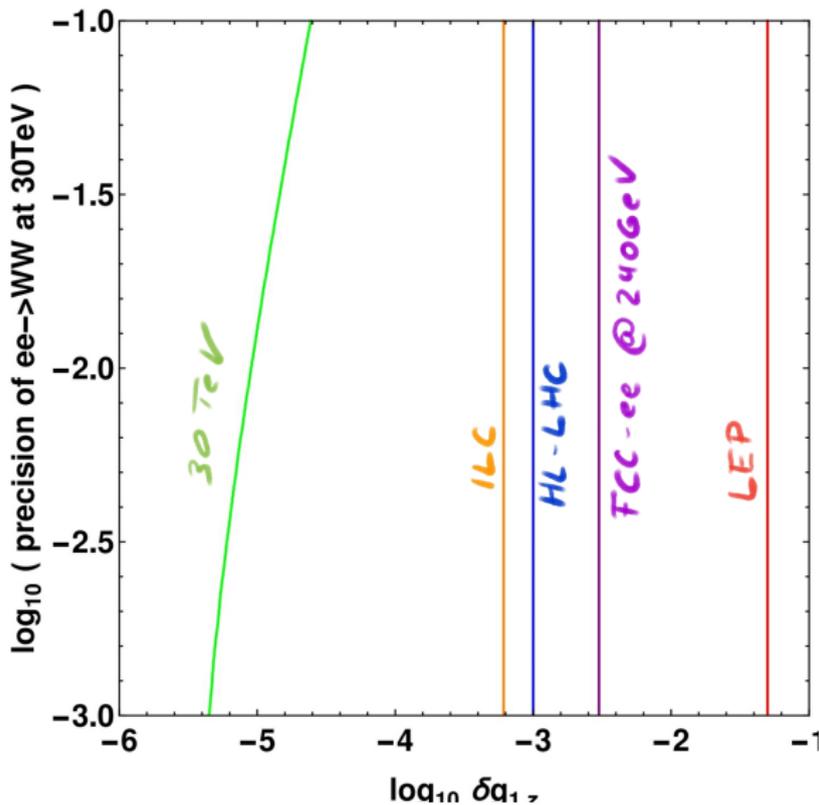

$$\mathcal{M}(LL; 00) = i \frac{s}{m_W^2} \frac{e^2 \sin \theta}{2s_W^2} \left[ (2T_f^3) \delta g_L^{Wq} - \delta g_L^{Zq} - \delta g_{1z} (T_f^3 - s_W^2 Q_f) + \delta \kappa_\gamma t_W^2 (T_f^3 - Q_f) \right] + \dots$$

$$\mathcal{M}(RR; 00) = i \frac{s}{m_W^2} \frac{e^2 \sin \theta}{2s_W^2} \left[ \delta g_R^{Zq} - \delta g_{1z} Q_f s_W^2 + \delta \kappa_\gamma Q_f s_W^2 \right] + \dots$$

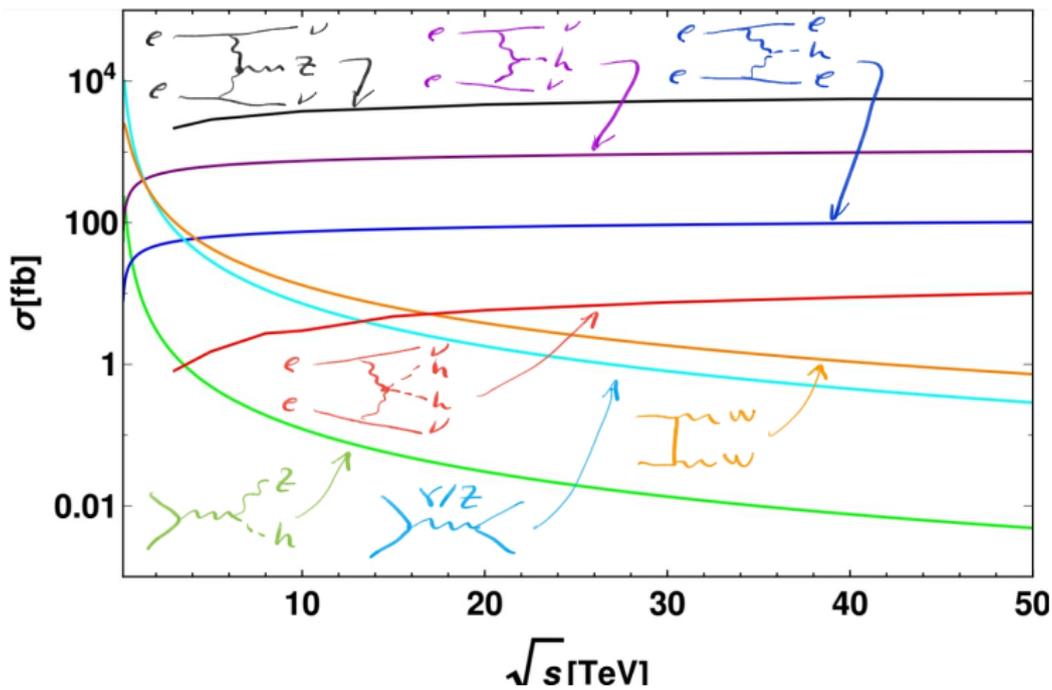

$$\delta g_{L,R}^{Zf} = \frac{1}{2} T_f^3 \left( -W - Y t_W^2 + T \right) + \frac{1}{2} Q_f \frac{s_W^2}{c_{2W}} \left( W + Y(2 - t_W^2) + T - 2S \right),$$

$$\delta g_{1z} = \frac{1}{2c_{2W}} \left( T + W + Y t_W^2 - (S - S^T) - (S + S^T) t_W^2 \right),$$

# Back of the envelope estimate at 30TeV

# Hierarchy of cross sections at high energy

## *Conclusions*

- Deformations of the SM enhance some processes at high energy
- 30-ish TeV lepton collider will be able to test the SM not only at high energy, but also to high accuracy.
- Hierarchy of cross sections is peculiar, not clear what would be the important channels to look at.

Thank you
