# ISBM working group

# Target and ion Source Development (TISD) mandate

Providing a large choice of **intense** and **pure** radioactive beams

Constant development is required to keep ISOLDE at the forefront of RIB facilities

- target and ion source units
- target materials
- beam interactions (p2n converter)
- ion source design / mode of operation shared with ISBM group

- yield & release study
- ion source efficiency measurements
- prototype tests

Sharing same resources as the ISOLDE physics program

- WORKSHOP: target unit production
- OFFLINE: target quality control
- ISOLDE: beamtime

# Expected TISD @ ISOLDE (presented to GUI February 2017)

- Sc: Ti foils (CF4, RILIS)
- Te: yields with RILIS
- M(CO)<sub>x</sub> formation @ MEDICIS irradiation point
- ThO felt + Negative ion source
- LIEBE @ GPS-online
- STAGISO beam test
- Si from UCx
- TiC-CNT (pending safety clearance)

# Expected TISD @ ISOLDE (presented February 2017)

- Sc: Ti foils (CF4, RILIS) **DONE**
- Te: yields with RILIS **DONE**
- M(CO)<sub>x</sub> formation @ MEDICIS irradiation point **ongoing**
- ThO felt + Negative ion source **ongoing**
- LIEBE @ GPS-online **ongoing**
- STAGISO beam test **DONE**
- Si from UCx **ongoing**
- TiC-CNT (pending safety clearance) **pending**

# Scandium beams

Target: #565 Ta Ta

	<sup>43</sup> Sc $\beta^+ = 100\%$	<sup>44</sup> Sc $\beta^+ = 100\%$	<sup>45</sup> Sc Abundance=100%	<sup>46</sup> Sc $\beta^- = 100\%$	<sup>47</sup> Sc $\beta^- = 100\%$	<sup>48</sup> Sc $\beta^- = 100\%$	<sup>49</sup> Sc $\beta^- = 100\%$	<sup>50</sup> Sc $\beta^- = 100\%$	<sup>51</sup> Sc $\beta^- = 100\%$

# The LIEBE target – Assembled

LIEBE fully assembled and coupled to offline 1

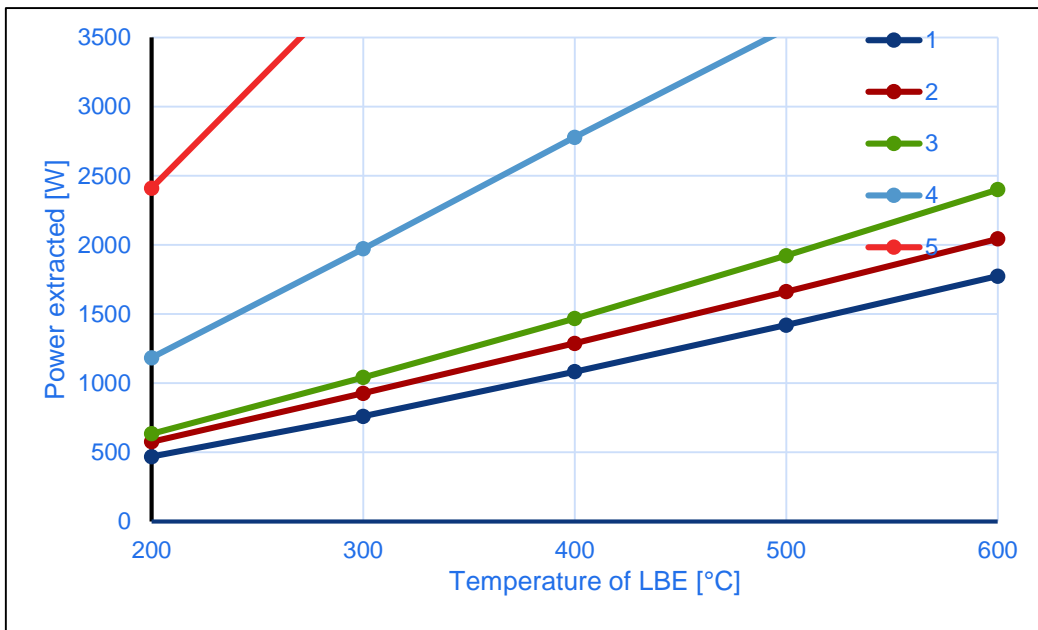

F. Boix Pamies

LIEBE loop before enclosure.

# The LIEBE target – Offline tests

- Offline tests:

- Leak tests
- Vibration tests
- Heat exchanger calibration**
- Ion source test

3D model of the heat exchanger, 5 water channels to cope with 5 different temperatures.

- Offline tests 6<sup>th</sup>-10<sup>th</sup> November
- Operational review 3<sup>rd</sup> week of November
- Target to be installed at GPS end of November

Ansys CFX simulations of heat exchanged for every water channel.

F. Boix Pamies

# Dedicated test stand for ion source development

ISOLDE calibration stand

integration

### Main features:

- ion **beam extraction** and detection
- residual gas analyzer (RGA)
- **automated control and data recording (LabVIEW)**

### First application:

- **negative ion source** development
- investigation of source poisoning and regeneration

### Future plans:

- long-term performance studies
- thermal stress tests
- destructive tests
  - **operational limits**
  - **failure mode analysis**

D.Leimbach

# Low work function materials for negative ion production

## MK4 – Pellet source

## Tubular low workfunction cavity

### Improvement of ionization efficiency:

- Elements with low affinities are not efficiently ionized by LaB<sub>6</sub>
- New compounds needed:
  - SrVO<sub>3</sub> with expected work function <2eV

### First steps:

- Production of suitable candidates
- Electron emission tests with LaB<sub>6</sub> as benchmark
- Performance studies

### Next steps:

- Compare geometries offline

D.Leimbach

# LIST

HFS studies of polonium / suppression of francium (IS456, September 2012)

**LAR/SSA**

JOHANNES GUTENBERG  
UNIVERSITÄT MAINZ

Isobaric suppression  $> 1000$ , efficiency loss  $\approx 50$

*On-line implementation and first operation of the Laser Ion Source and Trap at ISOLDE/CERN, D. Fink et al., NIMB 344, 83-95 (2015)*

*In-Source Laser Spectroscopy with the Laser Ion Source and Trap: First Direct Study of the Ground-State Properties  $^{217,219}\text{Po}$ , D. Fink et al., PRX 5, 011018 (2015)*

R.Heinke

# LIST 2018

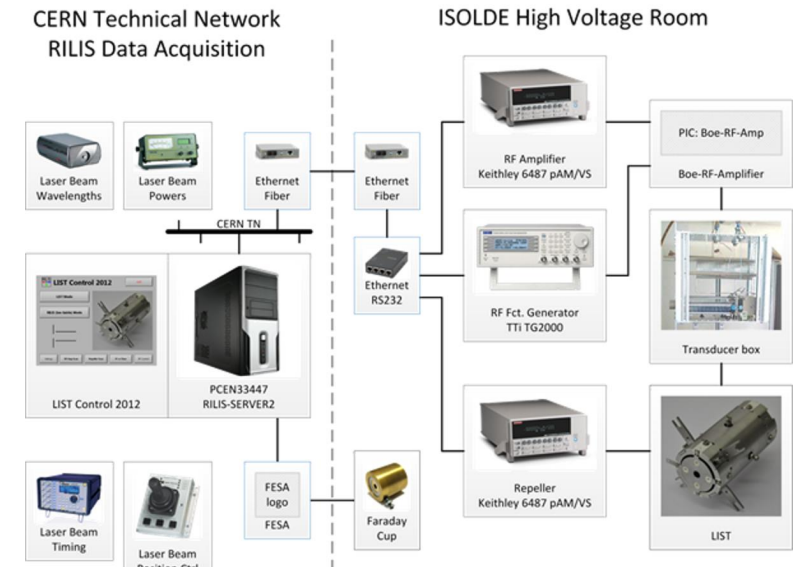

- Obtained technical drawings from Larissa Group Mainz

<https://edms.cern.ch/document/1400724/1>

- LIST 2.0 assembly will be provided from Mainz
- To be verified: status of RF cable at GPS
- LIST control system: replicate 2012 setup

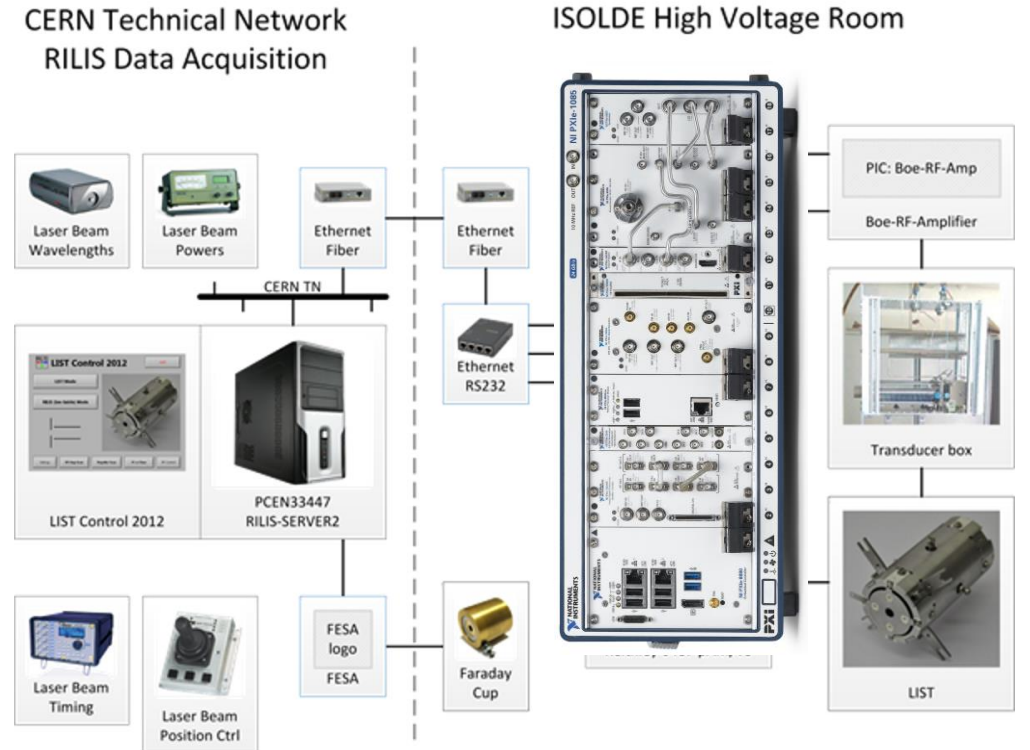

R.Heinke

# LIST Development (LS2)

- Full integration to ISOLDE infrastructure
- Fast line heating inversion
- Connection to quartz transfer line
- Connection to ToFLIS project

# Volatile Carbonyl Compounds for New Refractory Beams at ISOLDE

J. Ballof<sup>1,2</sup>, C. Seiffert<sup>1</sup>, Ch. E. Düllmann<sup>2,3,4</sup>, J. P. Ramos<sup>1</sup>, S. Rothe<sup>1</sup>, T. Stora<sup>1</sup>, A. Yakushev<sup>3,4</sup>

## Motivation

Potentially 9 new radioactive beams!

1																	5	6	7	8	9											
H																	B	C	N	O	F											
3	4															13	14	15	16	17												
Li	Be															Al	Si	P	S	Cl												
11	12															19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35
Na	Mg															K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br
37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53																
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I																
55	56	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85																
Cs	Ba	La...	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At																

Forms Carbonyl: V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Ge, As, Se, Br, Te, I

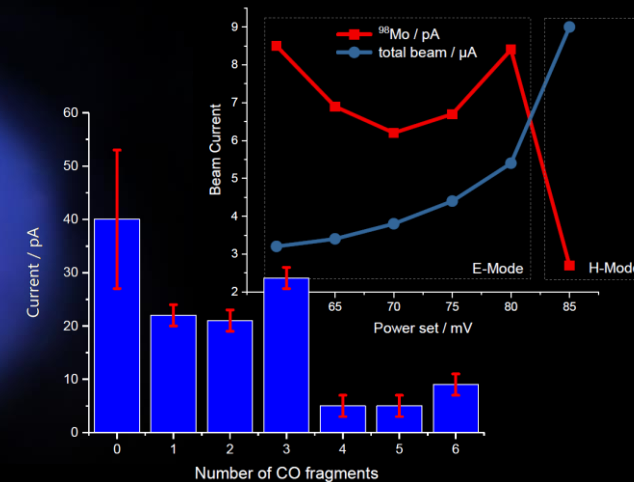

Unavailable beams: B, C, N, O, F, Al, Si, P, S, Cl, Ga, Ge, As, Se, Br, Te, I

Available Beams: V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Ge, As, Se, Br, Te, I

FLUKA results for the generated nuclides

J.Ballof

# Neutron deficient SeCO beams

Principle:  $\text{Se} + \text{CO} \rightarrow \text{SeCO}$

Target #605 and #612

Zirconia fibers, stabilized with ca. 10% Ytria

*Shifting the mass to get pure beams*

Beam available since many years.

but....

- $\text{SeCO}$  gone after a few days
- Atomic Se still released after days

➔ Indications, that  $\text{CF}_4$  gas might serve as carbon source. Work in progress.

Why does  $\text{SeCO}$  disappear, even if we inject  $\text{CO}_2$ ?

**Injected  $\text{CO}_2$  gas does not promote  $\text{SeCO}$  formation!**

**What's the source of carbon?**

Carbon from the ion source?

-> Placed graphite grid, but still depleting

Carbon from the target material?

-> EDS (preliminary) shows no carbon in ZrO fibers

# Boron fluoride beams

Principle:  $B + 3 F \rightarrow BF_3$  Volatilization of refractory boron by injection of  $SF_6$  gas

## First prototype #499

- Small gas leak ( $3.7e-5$  mbar L / s)
- Absence of  $TaF_x$  and  $SF_x$  in mass spectra

➔ Unit did not produce  $BF_x$  beams  
no fluorine saturation

## Second prototype #513

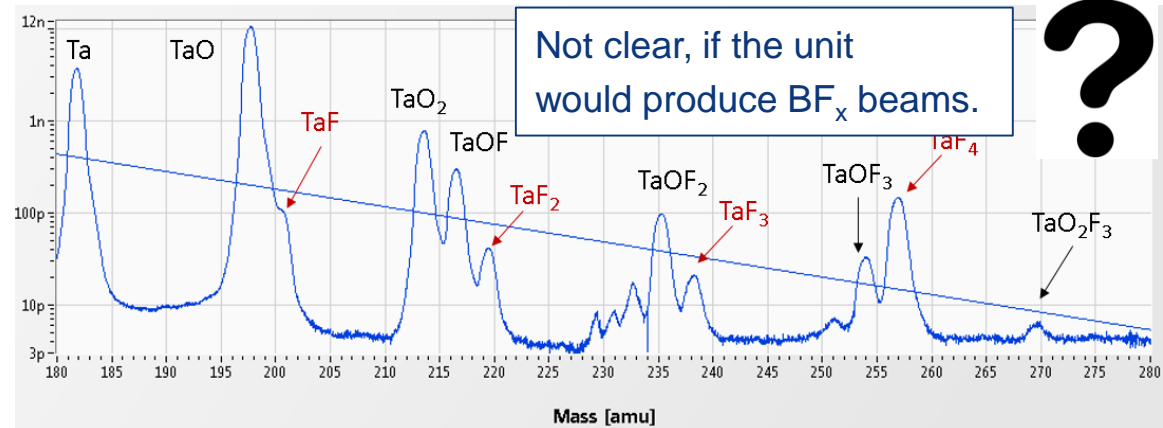

- Increased leak ( $1.84e-4$  mbar L/s)
- Strong  $TaF_x$  and  $SF_x$  peaks
- No TaO peaks

➔ Stable and intense  $8BF_x$  beams

## First production unit #606

Despite high injection,  
low fluorination, and presence of oxygen.  $H_2O$  or air leak?

TaO<sub>x</sub>F<sub>y</sub> deposits in target

Gas line rupture

# Ion source simulations: VSim

Is a flexible, multiplatform, multiphysics software tool for running computationally intensive electromagnetic, electrostatic, magnetostatic, and plasma simulations in the presence of complex dielectric, magnetic, and metallic shapes.

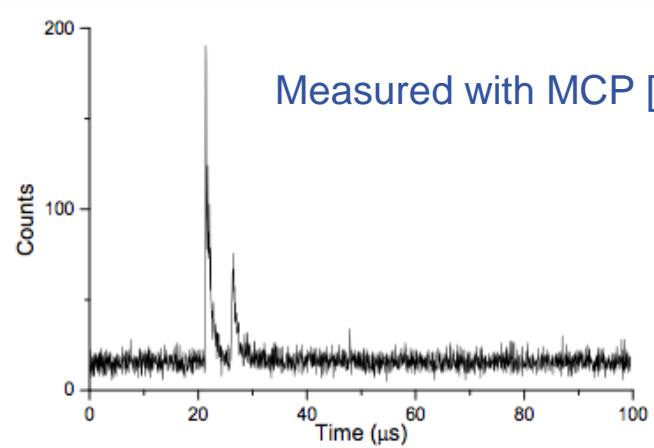

(<https://www.txcorp.com/vsim>)

1 kCHF per core / year  
License purchased for 2016/17

## Goal: Full Simulation VADIS ion source

- 1<sup>st</sup> reproduction of electrostatic field distribution inside the VADIS using PIC code

[1] T. Day Goodacre et al., NIM B 376, 39 (2016). [2] Y. Martinez et al. In preparation.

Y.Martinez

# VADIS / VADLIS developments

Standard VADIS

Extraction plates 0 V

VADIS Dev. [2]

Extraction plates -100 V

2D voltage scan (RILIS mode)

[2] Y. Martinez et al. In preparation

Y.Martinez

# Clean $^{206}\text{Hg}$ beams with VADLIS

- 3<sup>rd</sup> on-line application of VADLIS ion source for an experiment
  - (full Hg chain for in source laser spectroscopy; Mg + Ne for ISOLTRAP,  $^{206}\text{Hg}$  for Miniball)
- RILIS-mode achieves similar efficiency to VADIS-mode
- Note: RILIS-mode efficiency is expected to improve by at least **2 X** if the adjustable-extractor VADIS is used.

B.Marsh

# VSim - Future

## Suggestion:

- **Continue licensing** of the software. Different models available.
- **Extend simulations** to negative ion source and plasma source (David, Jochen)
- Purchase **dedicated server** hosted by EN-STI-RBS
- Endorse **collaboration** with SCK.CEN and VSim users at CERN.
- Organize ISOL related User meeting

# VAD(L)IS - Future

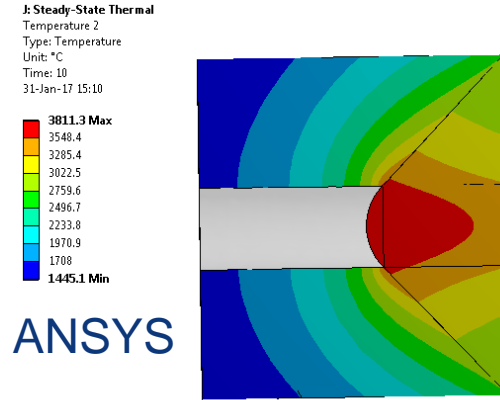

- Continue development & simulations (separate grid electrode, geometries, assembly)
- Validate development steps both off-line and on-line
- Extract Negative ions (speculative)

# p2n-converter development (as Presented in previous GUI)

Within CERN-TRIUMF MoU + SCK-CEN

50 kW , 500 MeV beam

- Project Started in December
- Weekly meetings with CERN/TRIUMF/SCK

Preliminary time line:

J.P.Ramos

# ISOLDE neutron converter design

## Done:

- Systematic FLUKA simulations for geometry optimizations

## At the moment:

- Thermomechanical simulations of the larger oven
- Procurement of materials
- mechanical design of prototype

	New	Old
n-ind fissions (/s)	2.79E11	4.55E10
p-ind fission ratio	10.8%	16.1%
Deposited Power	690 W	553 W
UCx Volume	60 cc	30 cc

Proton fluences

Neutron Fluences

Main challenges: **Large oven to heat up** and electrical **insulate tungsten from oven current**

# FEM model p2n Target: container temperature (1000 A)

- Container outer diameter: 51 mm
- Container thickness: 0.25 mm
- SGL® **SIGRATHERM** thermal screen: 10 mm
  - <https://edms.cern.ch/document/1128002/1>
- Mo thermal screen: 0.2 mm

To be used for **MEDICIS target** and potentially for p2n target at TRIUMF

M. Ballan, INFN

S. Marzari

# Optimize Target heat screens

- Sigratherm study: [EDMS:1128002](#)
- Obtain reproducible temperature calibration
- Design thermal profile for uniform heating

S. Marzari

# STAGISO vs NORMISO Study

J.P. Ramos

- Release measured on:
- GPS and HRS
  - Target and Converter
  - <sup>26</sup>Na and <sup>142</sup>Cs

No difference between STAGISO vs NORM

Results to be published soon.

# Ucx production: Previous process

Setting ramp

Monitor pressure via webcam

Write down values manually

Detect end of carburization by pressure drop

May result in inconsistent carburization.  
Time consuming (~10 days).

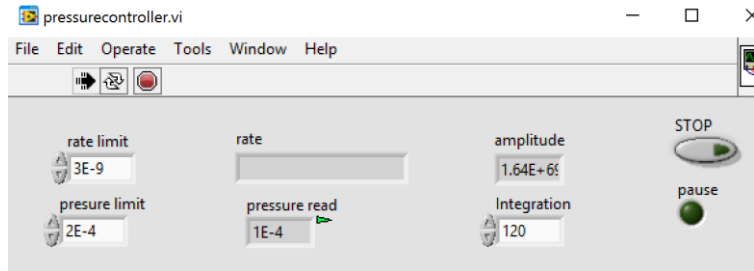

CARBURATION UO2+C

# Automatic UCx Production

- Setting a ramp
- Set thresholds
- Start carburization

- Heating is regulated automatically

Successfully used for **UC611** and **UC618**  
Finished in **4 days** without human intervention

# Proposed solution for production

- Integrate pressure readout using **CERN standards**
  - LabVIEW support / Vacuum support (requires new pumps/readouts) [BUDGET]
- Integrate pressure veto to pumpstand control software
  - LabVIEW support
- Add residual gas analyzer: gives additional information to the production process. Production speed could be optimized. Also contaminants could be identified during production.
  - Requires ~10k CHF + integration through LabVIEW support.

# MWCNT Target production for #606

CERN has forbidden any handling of nanomaterial

- Nanomaterials are requested at ISOLDE for physics (in this case MWCNT)

Powder technology laboratory in **EPFL**, has a class “nano 2”

- Accordingly to EPFL specifications “nano 3” is needed to handle MWCNT (need to have the nanomaterial sealed in glovebox)

Glove’s bag was bought from Sigma Aldrich and used instead of Glove’s box.

- Possible solution to lift the prohibition of handling nanomaterials

**Successful press of full batch of MWCNT for ISOLDE target #606**

J.P. Ramos, B. Crepieux, T. Stora, et al.

# Nanolab

## Option 1

1. Carburisation
2. Calibration
3. Hotte
4. Presse
5. Malaxeur
6. Boite a gants
7. Plan de travail

## Option 2

1. carburisation
2. Calibration
3. Hotte
4. Presse
5. Malaxeur
6. Boite a gants
7. Plan de travail

- Funding secured
- Construction to be finished 2018
- Connection of ventilation foreseen in 2019

# Dedicated oven for CaO production

Current issues:

- Thermocouple positioning difficult (can't trust readout)
  - Use pyrometer but readout is difficult in the 700 – 800 °C range
- Thermal gradient in the container makes process much longer than should
- CaO production unit difficult to handle in gloves box

- Precise control of temperature
- Temperature uniformity
- **Higher quality CaO**
- Quartz tube easy to handle in glovesbox
- Production will be reduced to half-day.

J.P. Ramos, et al.

# ISOLDE Yield Database YYDB(<https://isoyields2.web.cern.ch>)

## Features

- CERN SSO
- New Database design
- In target production (ABRABLA)
- Release curves available
- More target details visible
- Issue tracking

## Philosophy

- All measurements (TISD, USERS) get entered into YYDB
- Manually change attribute (measured -> validated -> published)
- Attribute determines visibility (after login, no login required)

## Future

- Web based interface allows entering of yields to registered users
- Add FLUKA results for in-target production
- Add yield prediction
- Establish link to CRIBE database

J.Ballof

Target Unit	
Target Number	UC385
Material	U Carbide
Ion source	VADIS Cold Plasma VD7
Transferline	Water cooled
Total thickness	50.00 g/cm2
Source efficiency	22%
Target condition comments	F contam.
Target temperature	2273 K
Source temperature	2073 K
n-conv.used	No
Laser status	Laser off

Secondary beam	
Yield Id	63
Isotope	204 g Rn (1.24 m 3 )
Yield	9.00e+6 uC
Method	B

For more information please contact the ISOLDE Physics Coordinator, [Karl Johnston](mailto:karl.johnston@cern.ch).  
 For more details and yield inquiries please contact the ISOLDE Target and Ionsource Development Group, Thierry Stora, Sebastian Rothe et al.  
 In case of technical problems with the website, please report an issue or send an email to the developers.  
 Database and web application created by Jochen Ballof, based on a previous version by Manuela Turroni and Ursula Herman-Iglicka as well as additions by Tania Manuela de Melo Mendonca. In-target production simulations conducted by João Pedro Ramos. Visualization of in-target yields by Kristoffer Bredt Nielsen. The shown data is evaluated and maintained by the ISOLDE Target and Ionsource Development Group (TISD), which is part of EN-STI-R&DS.
