

EMITTANCE MEASUREMENT PAPER

V. Blackmore, C. Hunt

CM 50

2nd March 2018

CONTENTS

- Go through paper plots
 - A lot of these haven't changed, but some have
- Then hand over to C. Hunt to talk about **systematic errors on magnetic field models**
- What're we looking at:
 - Run 7469
 - ISIS @ 700 MeV
 - SSU ECE coils at 4T fields, M1, M2 off
 - SSD all off
 - **Muon-mode** beam (low π -contamination compared to other analyses)
- Improvements made since last CM:
 - Analysis loop is beginning to shrink
 - Better track reconstruction (minimise Pt hole)
 - Same reconstruction in MC and data
 - Global tracking

THE ANALYSIS LOOP

CM 49

Someone proposes
something interesting

... different cuts?
... better tracker reconstruction?
... better MC agreement?
... convenient global tracking?

Distribution/selection
changes

Should it have changed?

... sometimes “yes”
... sometimes “no”

Make new “final” plots

... go through processing loops
... remember all the steps
... do mystic rain dance
... new plots appear

THE ANALYSIS LOOP

CUTS/BEAM SELECTION

CUTS

Table 1: The number of particles that pass each selection criteria. A total of 24 645 particles pass all of the described cuts.

Cut	No. surviving particles
None	53 276
One space-point in TOF0 and TOF1	37 619
Time of flight in range 27—32 ns	36 357
Single reconstructed track with $\frac{\chi^2}{N_{\text{DOF}}} \leq 4$	40 110
Track within fiducial volume of tracker	52 039
A worry? → Tracked radius at diffuser ≤ 90 mm	42 584
Muon hypothesis	34 121
All	24 645

CUTS

Table 2: The proportion of electrons, muons, and pions, at the upstream Tracker, that survive each cut in the Monte Carlo simulation. Application of all cuts removes all electrons and pions in the reconstructed Monte Carlo sample.

Cut	e	μ	π	Total	
None	1 676	46 113	203	47 992	← MC sample has 0.4% π
One space-point in TOF0 and TOF1	1275	37 574	151	40 015	
Time of flight in range 27—32 ns	71	39 267	152	40 322	
Single reconstructed track with $\frac{\chi^2}{N_{\text{DOF}}} \leq 4$	1 205	43 824	163	45 194	
Track within fiducial volume of tracker	1 641	43 903	175	45 719	
Tracked radius at diffuser ≤ 90 mm	1 332	32 270	112	33 714	
Muon hypothesis	298	38 285	40	38 630	
All	0	26 414	0	26 414	← Combination of cuts removes all MC contamination

CUTS

TOF0

TOF1

μ here

Used to have a virtual plane here for PID

TKU

Now evaluate PID here

decays to
e by here

Table 2: The proportion of electrons, muons, and pions, at the upstream Tracker, that survive each cut in the Monte Carlo simulation. Application of all cuts removes all electrons and pions in the reconstructed Monte Carlo sample.

Cut	e	μ	π	Total
None	1 676	46 113	203	47 992
One space-point in TOF0 and TOF1	1275	37 574	151	40 015
Time of flight in range 27—32 ns	71	39 267	152	40 322
Single reconstructed track with $\frac{\chi^2}{N_{\text{DOF}}} \leq 4$	1 205	43 824	163	45 194
Track within fiducial volume of tracker	1 641	43 903	175	45 719
Tracked radius at diffuser ≤ 90 mm	1 332	32 270	112	33 714
Muon hypothesis	298	38 285	40	38 630
All	0	26 414	0	26 414

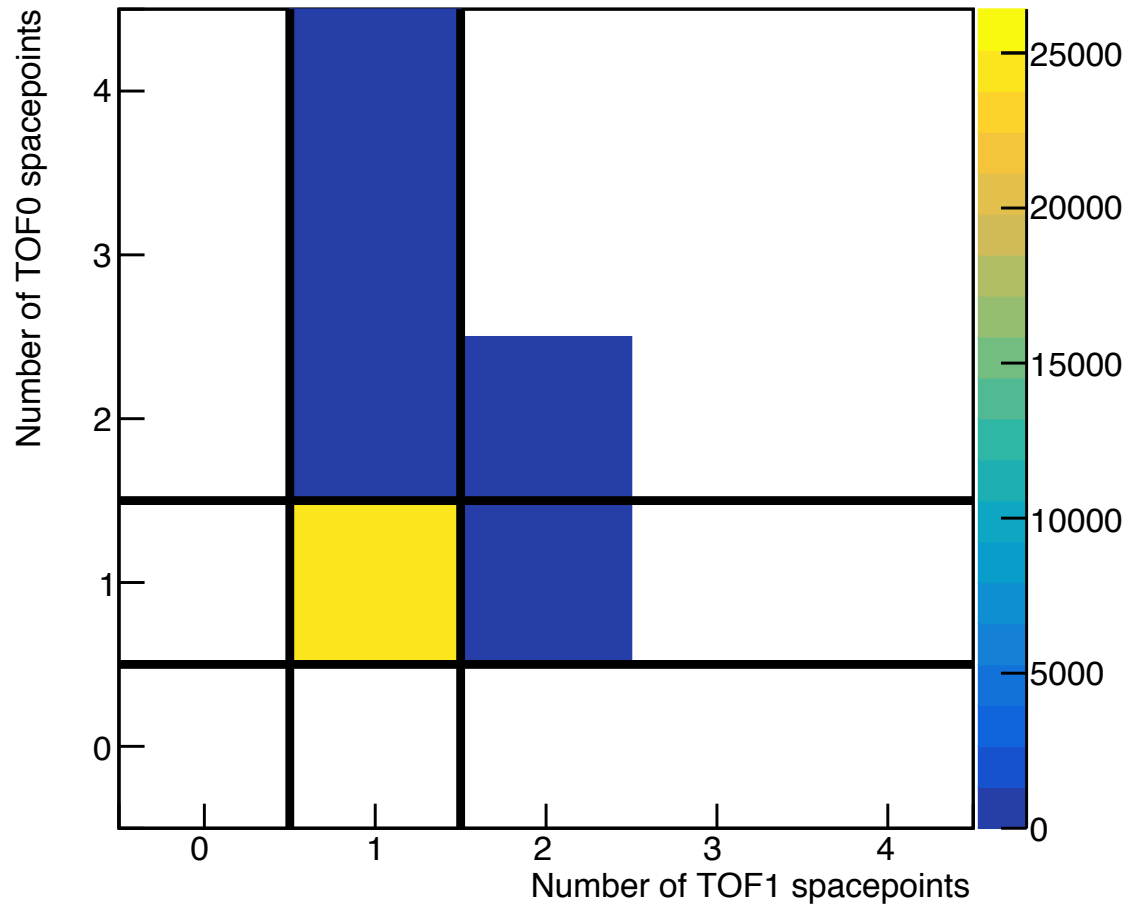

MC sample has 0.4% π

Combination of cuts
removes all MC
contamination

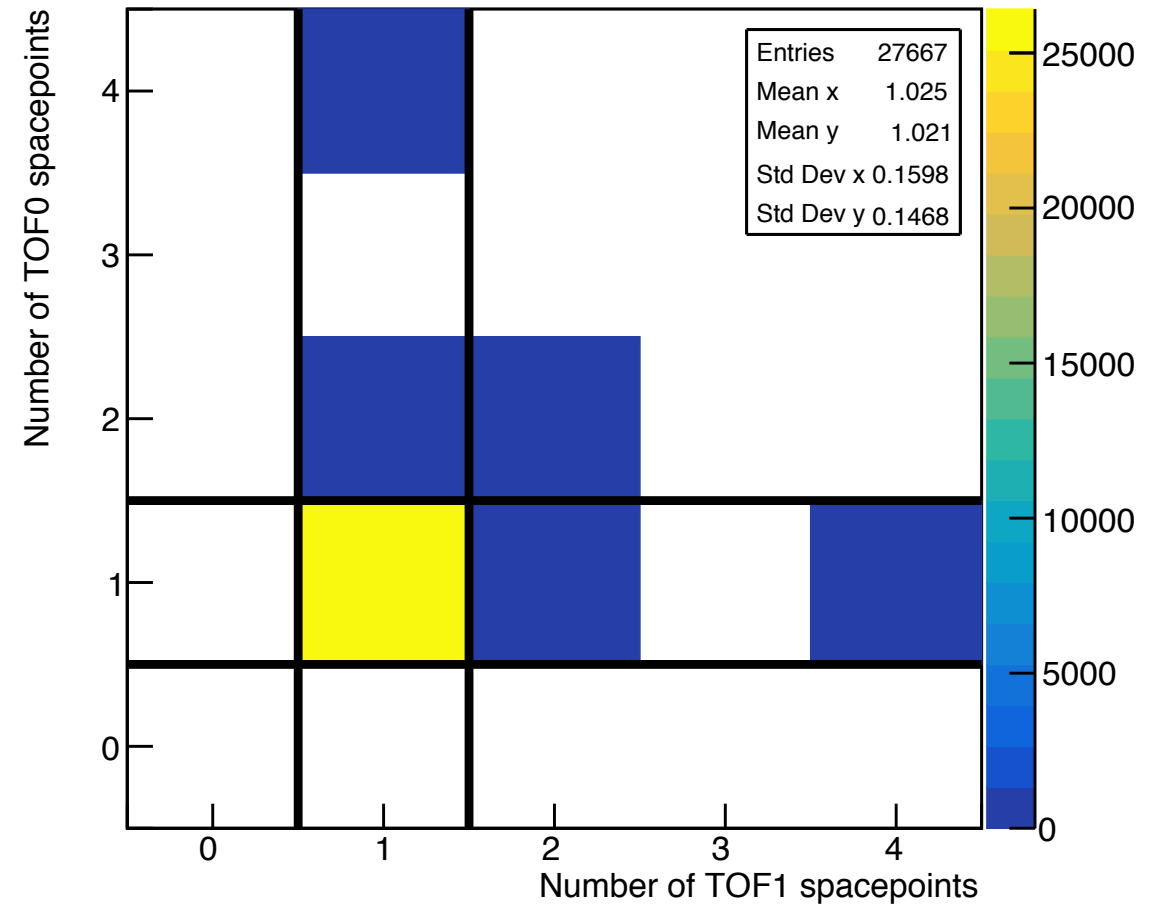

Plots are all cuts **except** the cut of interest

ONE SPACEPOINT AT TOF0 AND TOF1

Reconstructed Data

Reconstructed Monte Carlo

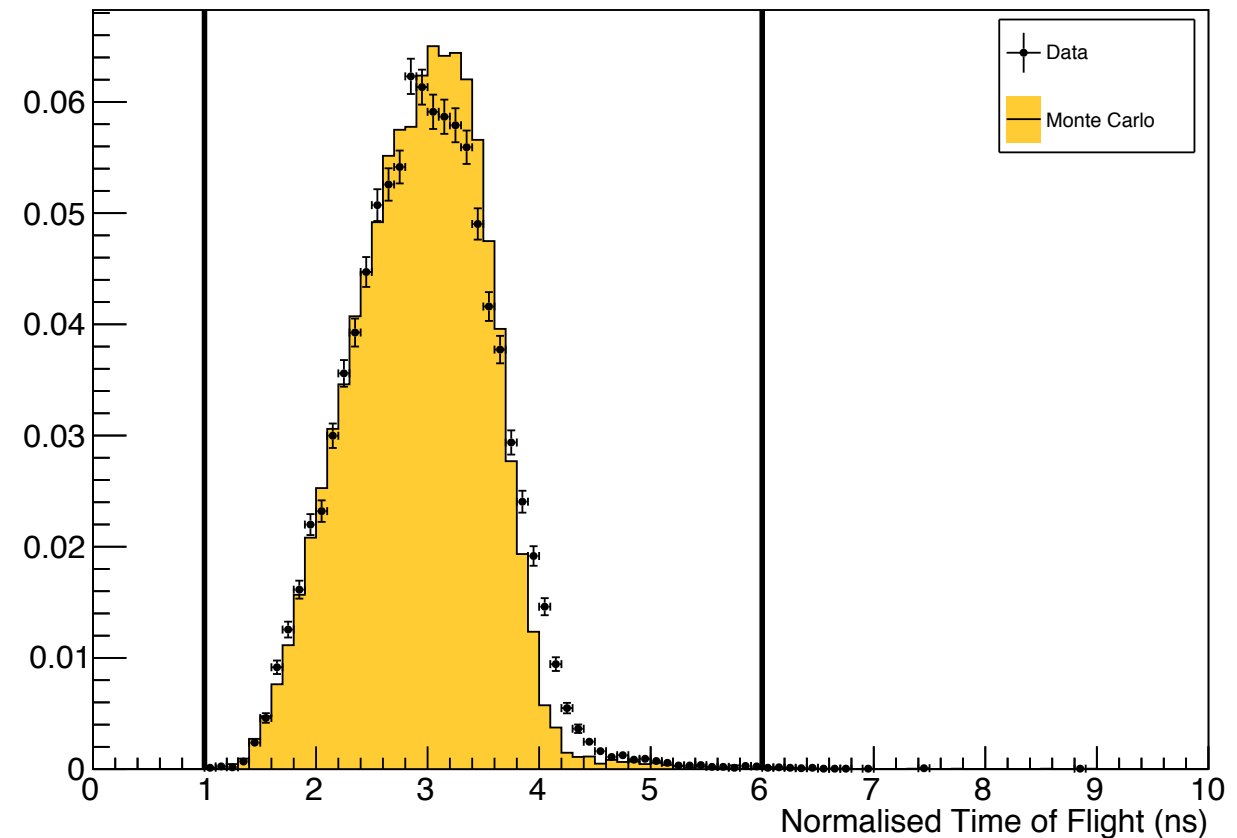

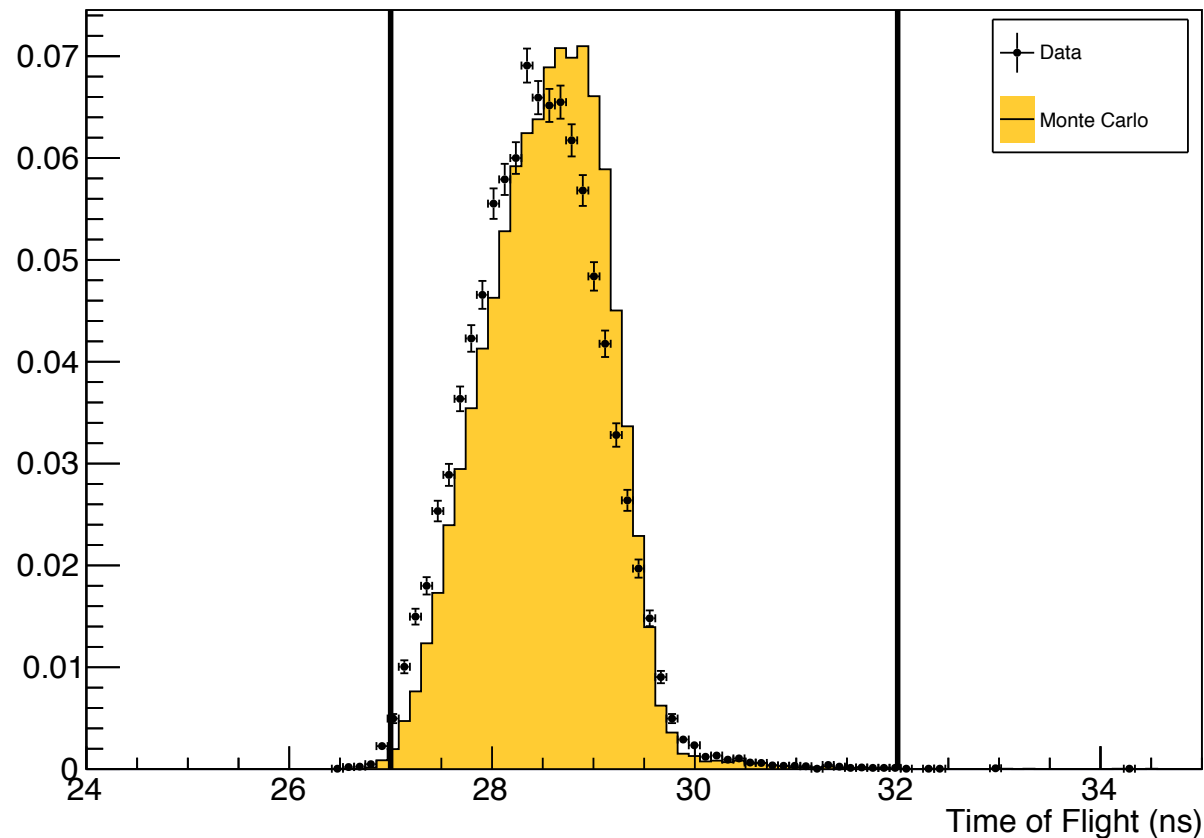

Plots are all cuts **except** the cut of interest

TIME OF FLIGHT ~ MUON

$$t_{\text{norm}} = t_{01} - t_e + \underbrace{\frac{(L + s)}{c}}_{\text{small path length correction: } L \sim 8\text{m}, s \sim 10\text{mm}}$$

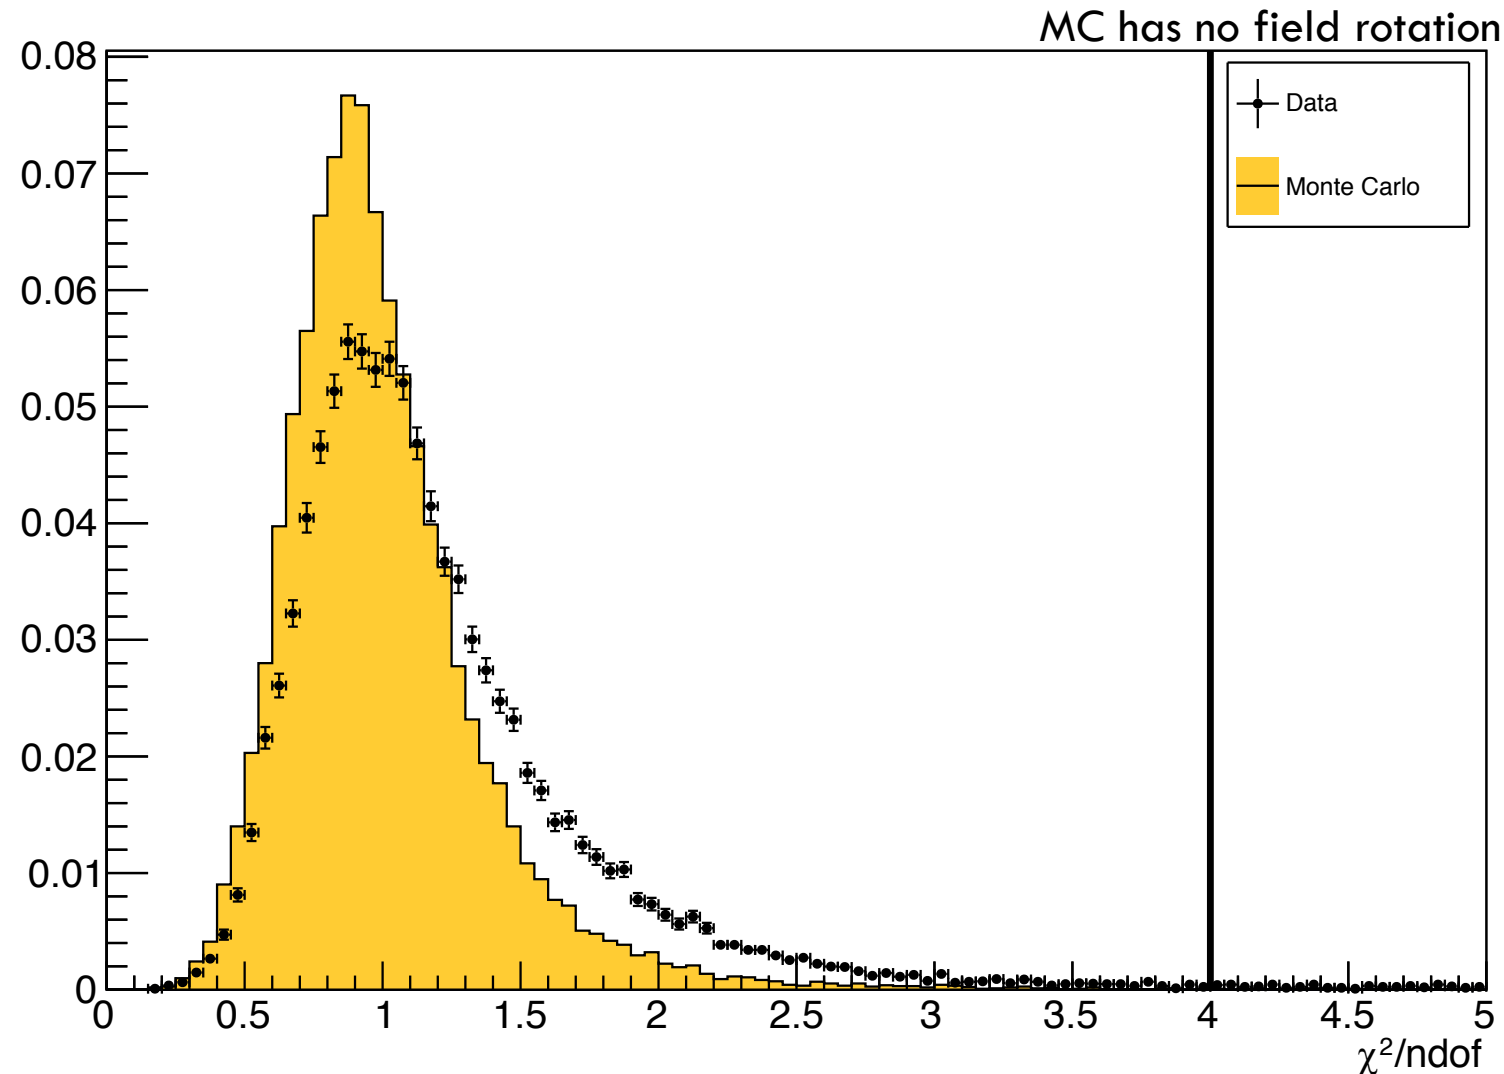

electron tof from data

CHI-SQUARE

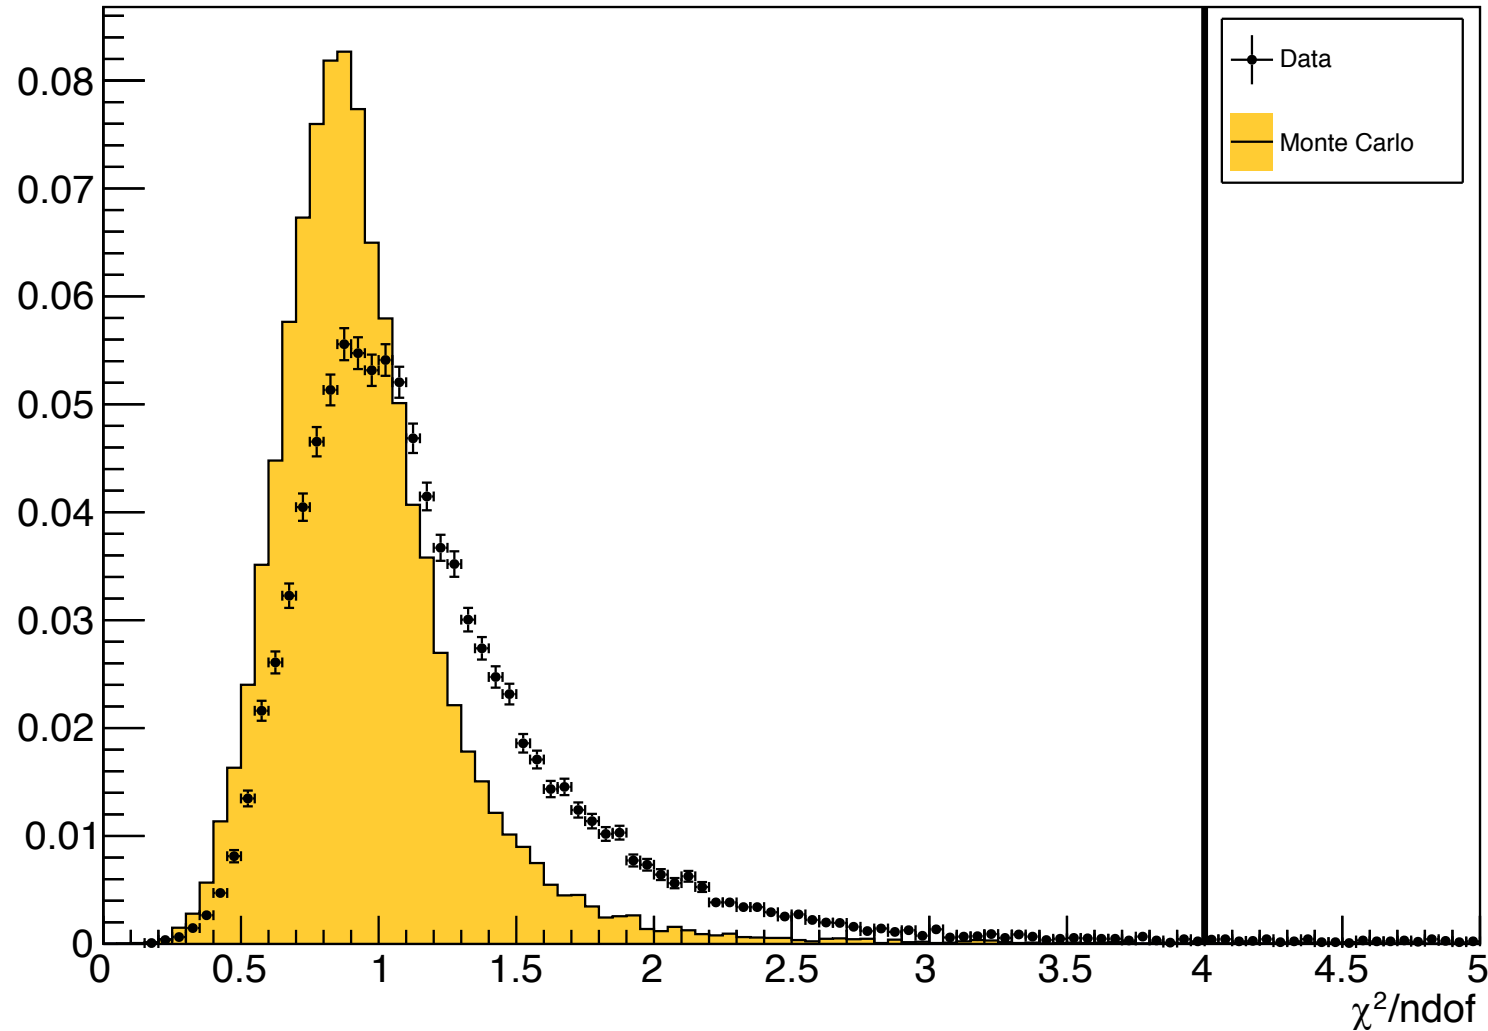

Agreement gets worse if field in MC is rotated

C. Rogers suggested could be insufficient noise in MC?

CHI-SQUARE

MC has 'aligned' field

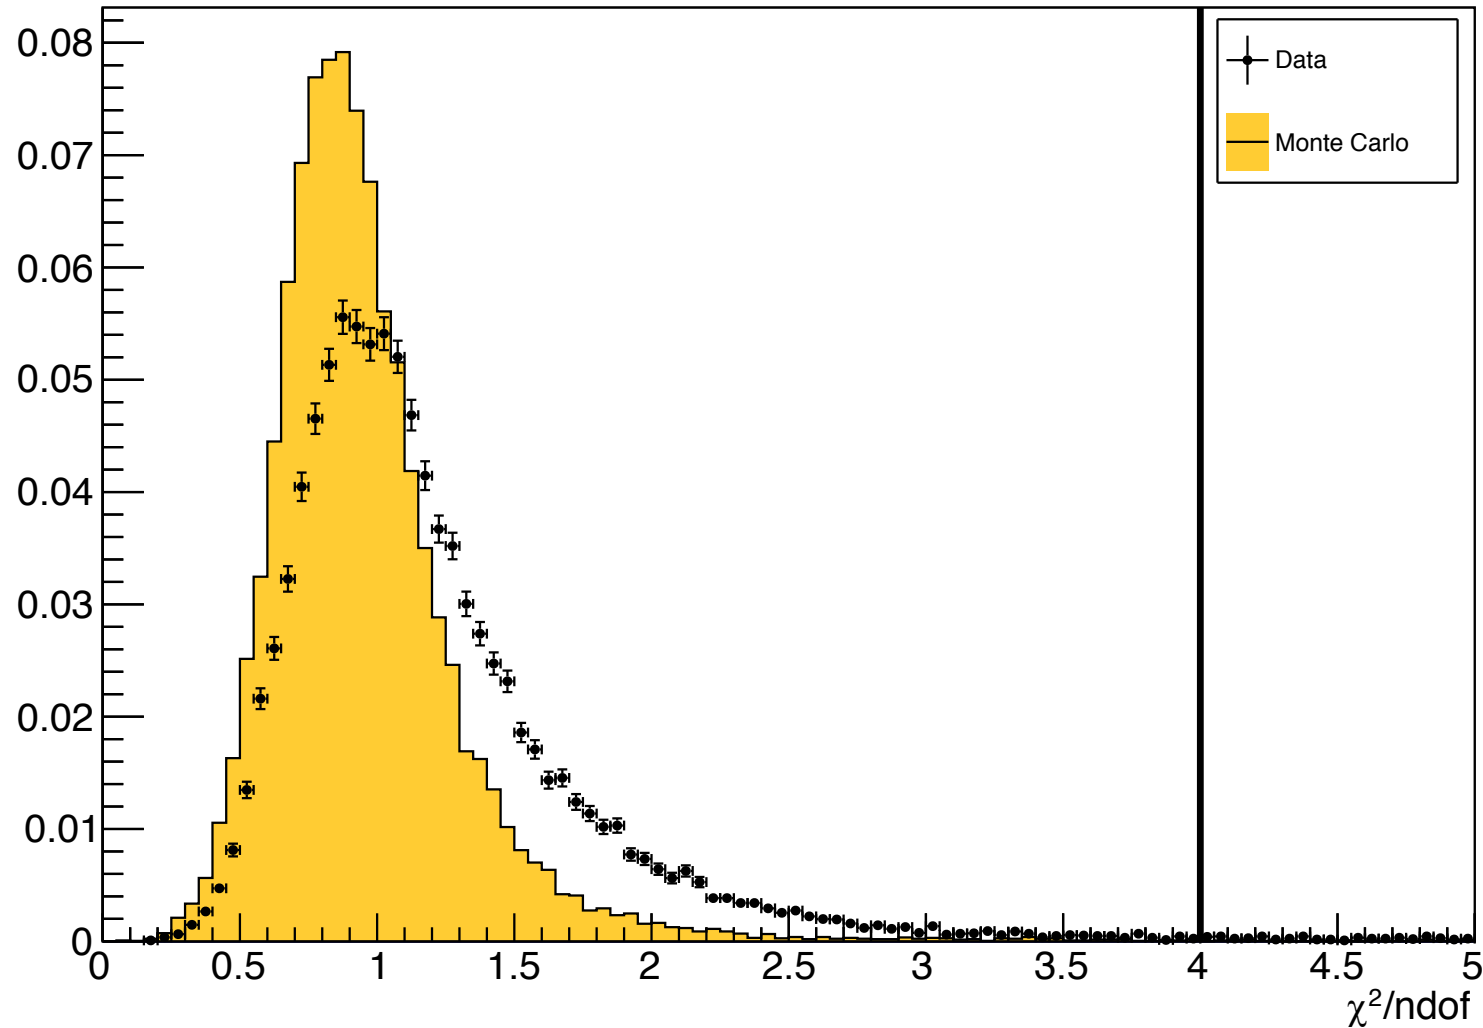

Agreement gets worse if field in MC is rotated

C. Rogers suggested could be insufficient noise in MC?

CHI-SQUARE

MC has 'aligned + 1 sigma' field

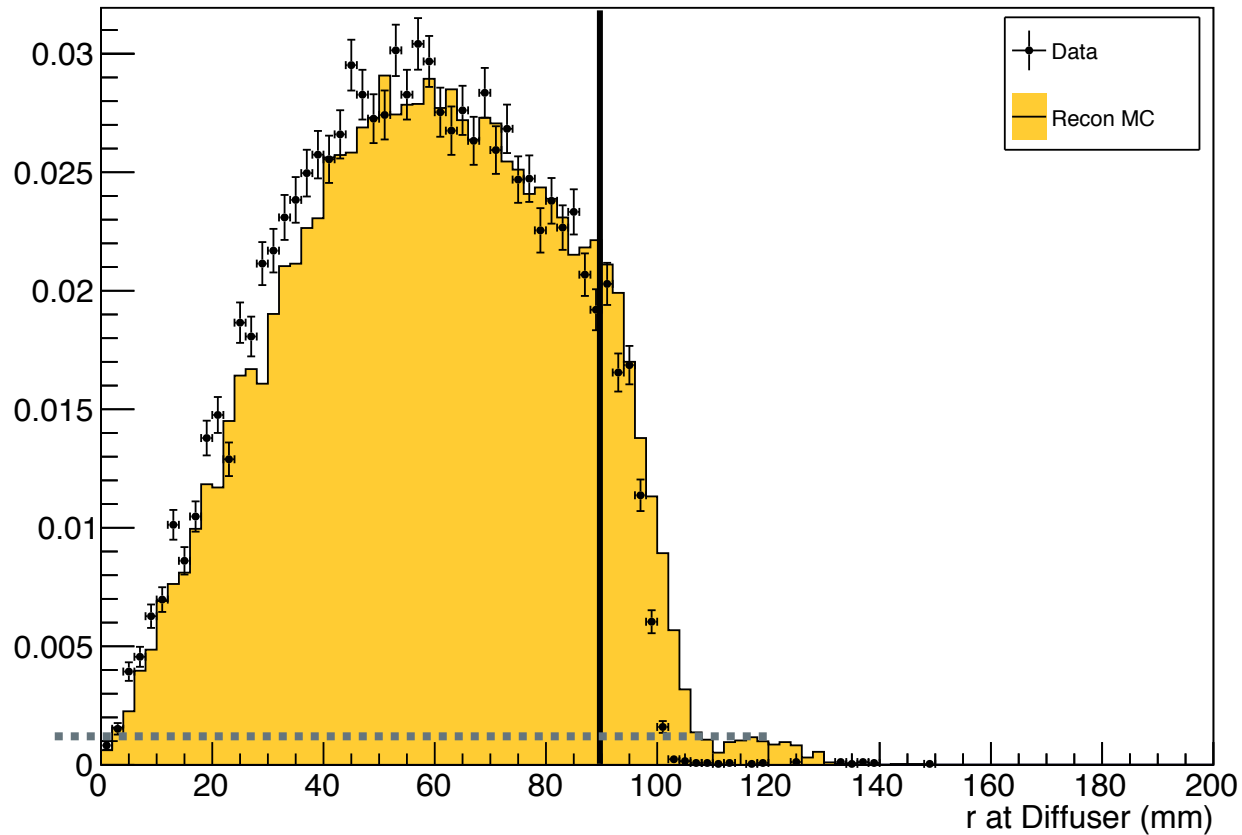

Agreement gets worse if field in MC is rotated

C. Rogers suggested could be insufficient noise in MC?

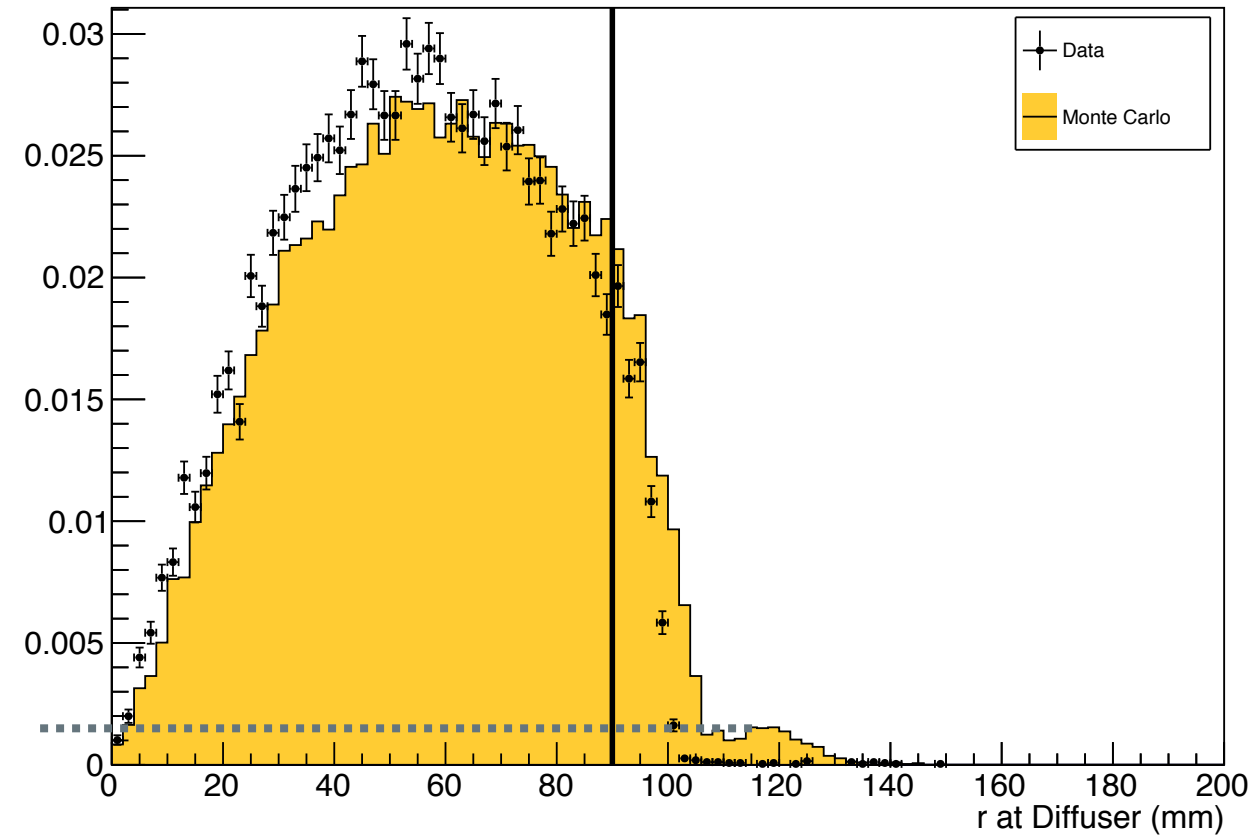

Plots are all cuts **except** the cut of interest

DIFFUSER CUT

MAUS 3.0

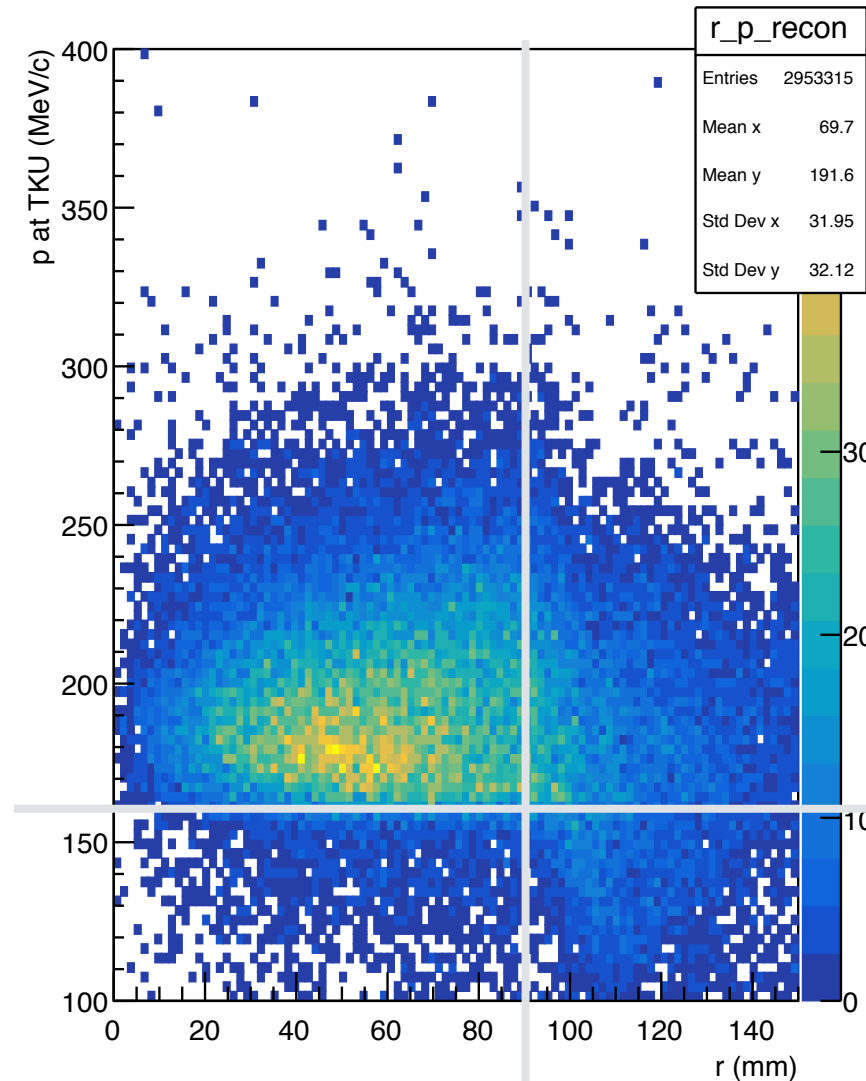

MAUS 3.1

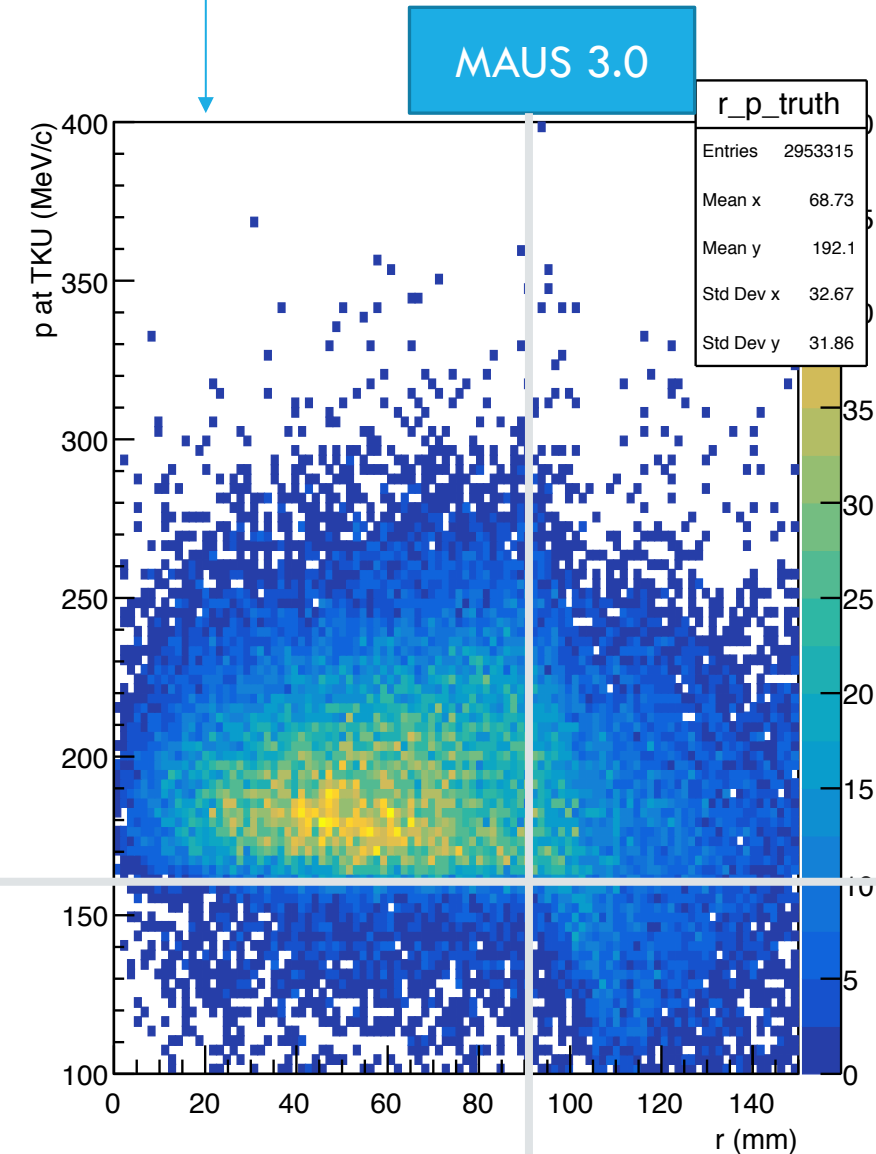

DIFFUSER CUT

• Explanations?

- Diffuser geometry hasn't changed...?
- Input distribution hasn't changed
- Track fitting routine **has** changed
 - But shouldn't change the **truth**.
- Plots are **without cuts**
- MAUS 3.1 and 3.0 MC's
- P at TKU ref plane
- r at d/s side of diffuser
 - Tracked w/ globals
 - Truth at virtual plane

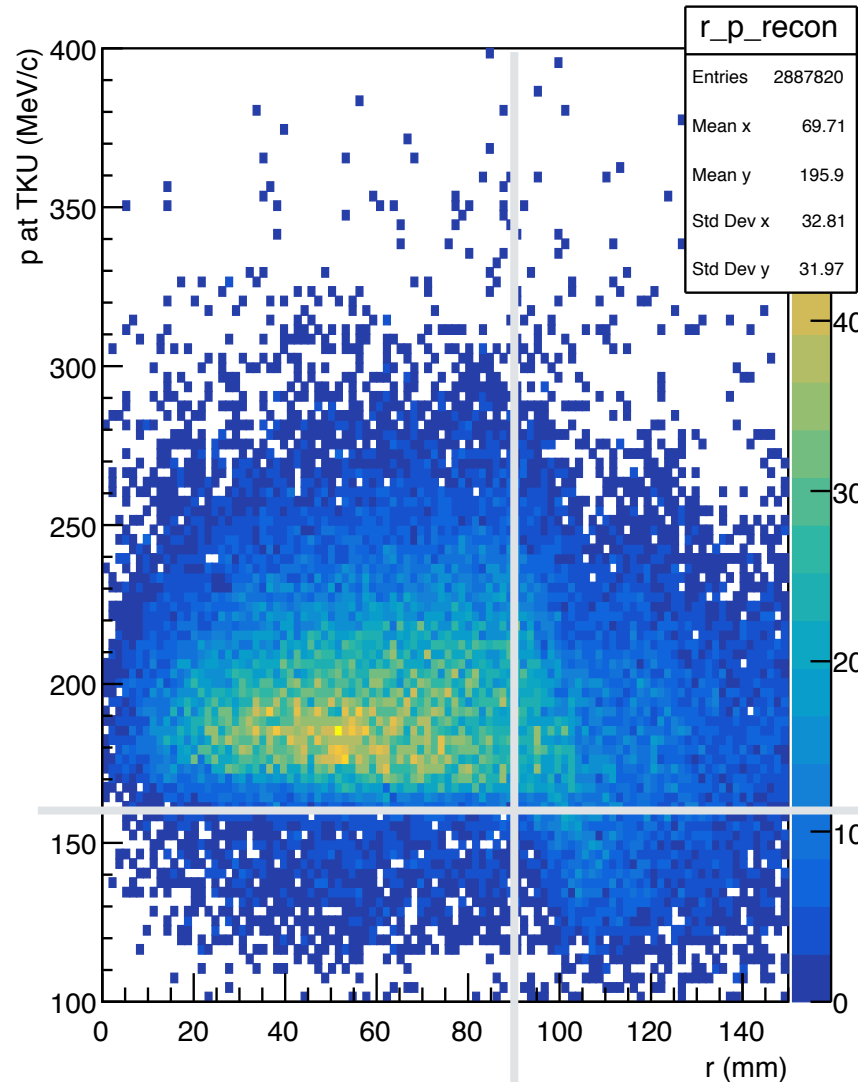

Why does MC truth change?

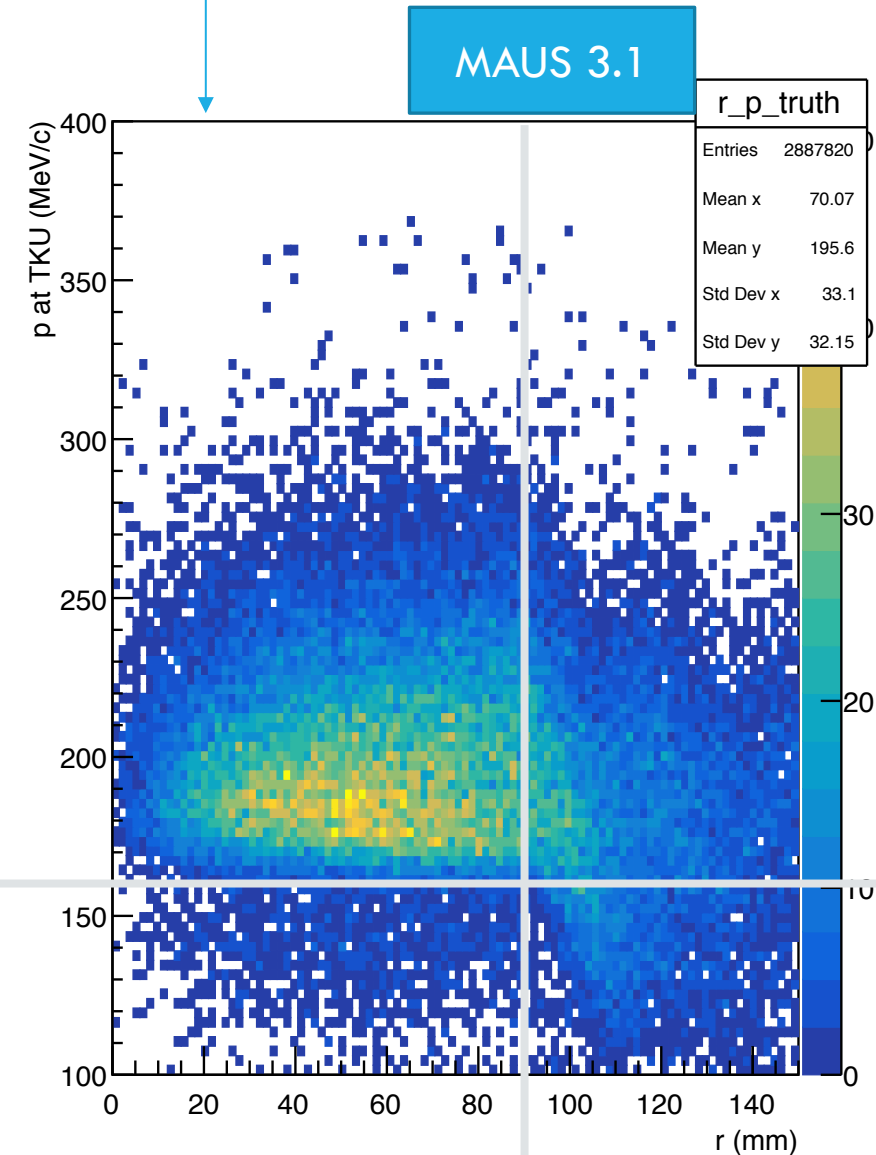

DIFFUSER CUT

- Explanations?

- Diffuser geometry hasn't changed...?
- Input distribution hasn't changed
- Track fitting routine **has** changed
 - But shouldn't change the **truth**.
- Plots are **without cuts**
- MAUS 3.1 and 3.0 MC's
- P at TKU ref plane
- r at d/s side of diffuser
 - Tracked w/ globals
 - Truth at virtual plane

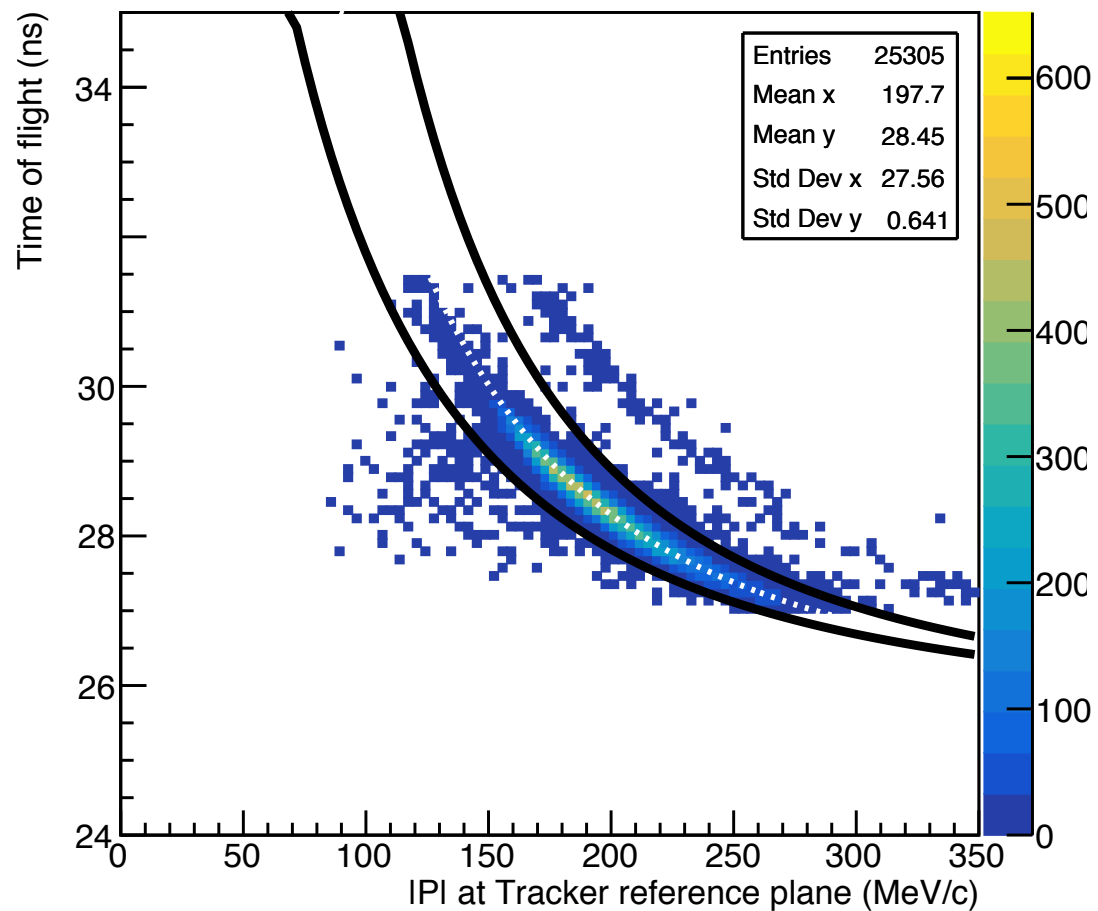

Why does MC truth change?

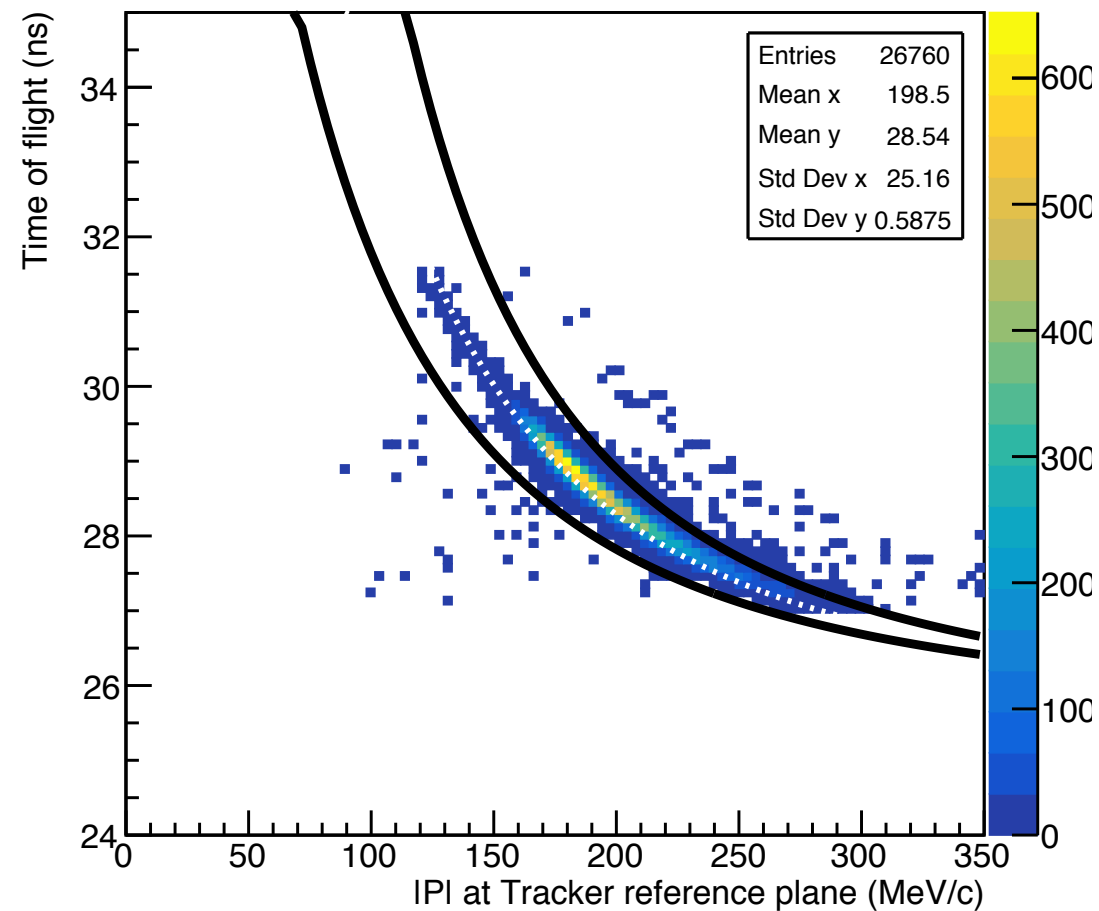

MUON HYPOTHESIS

Reconstructed Data

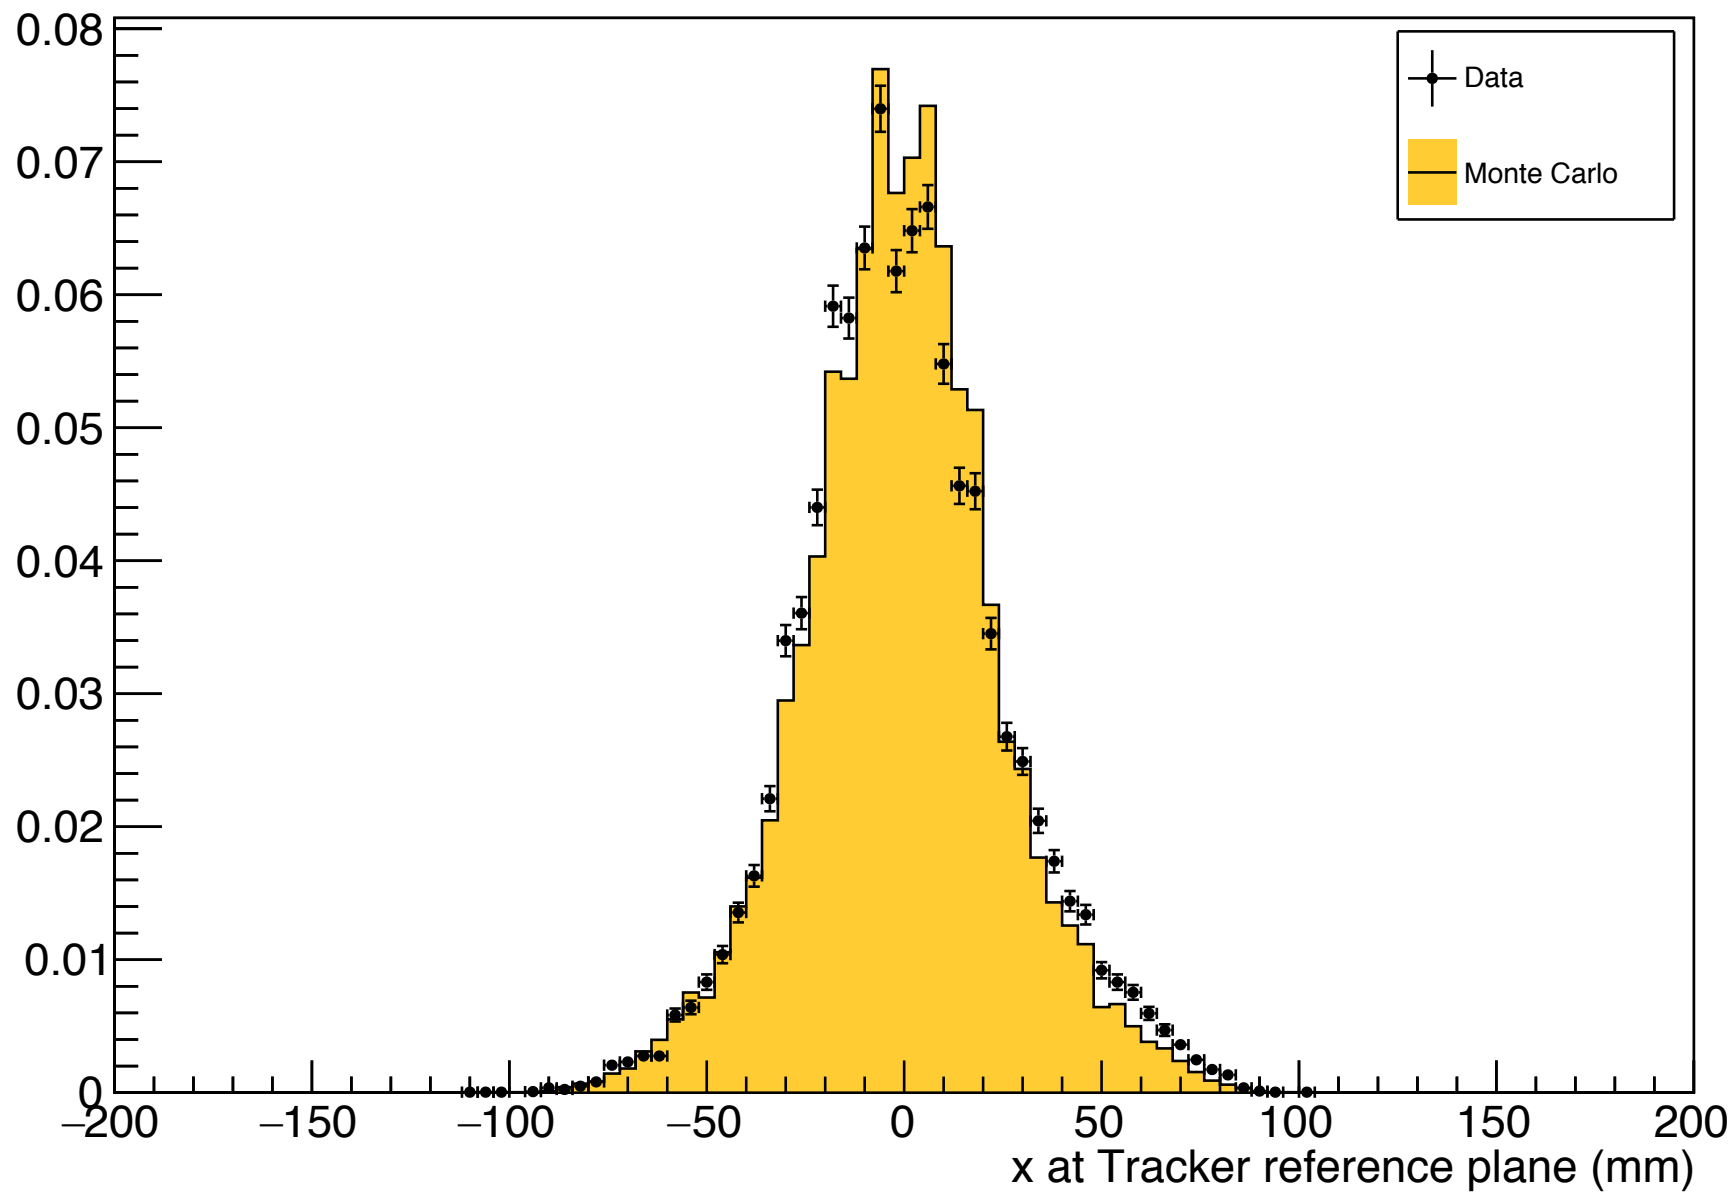

Reconstructed Monte Carlo

1D SELECTED DISTRIBUTIONS

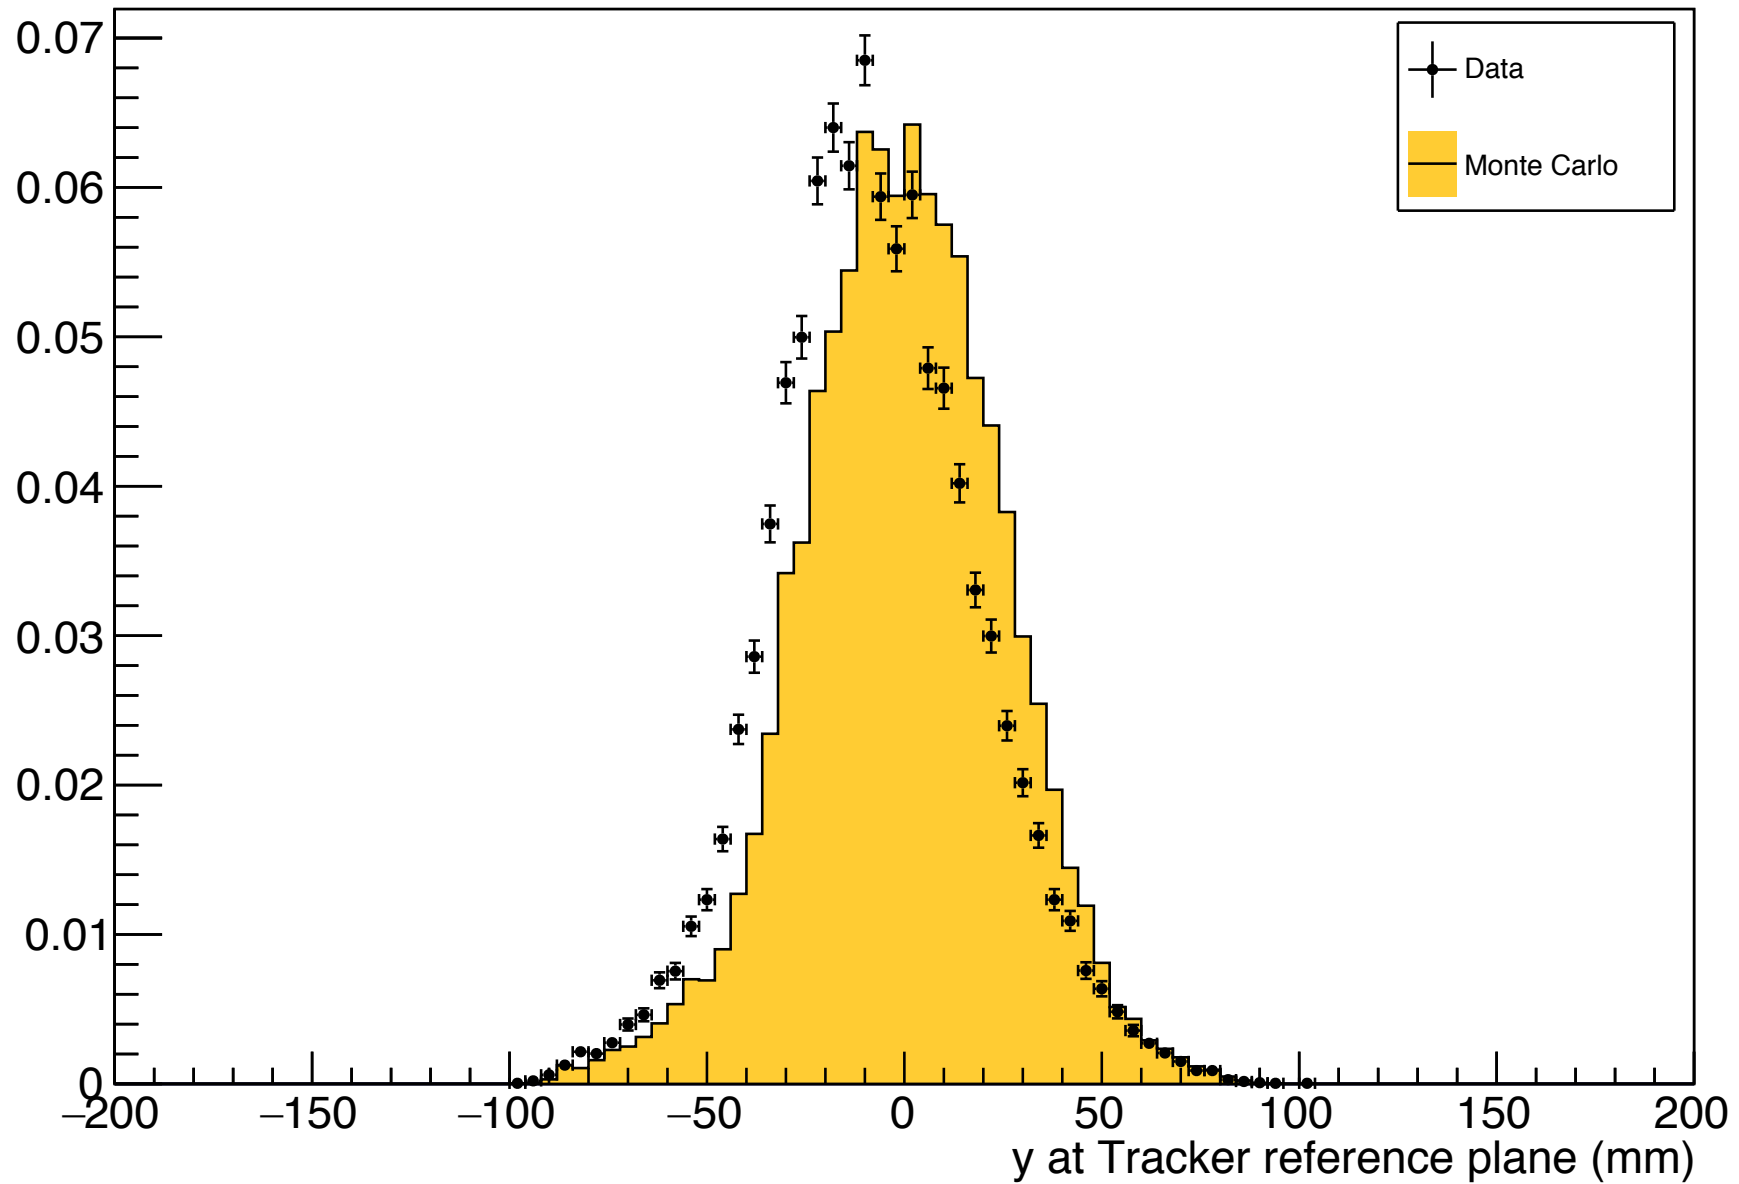

All cuts have been applied to these plots

X

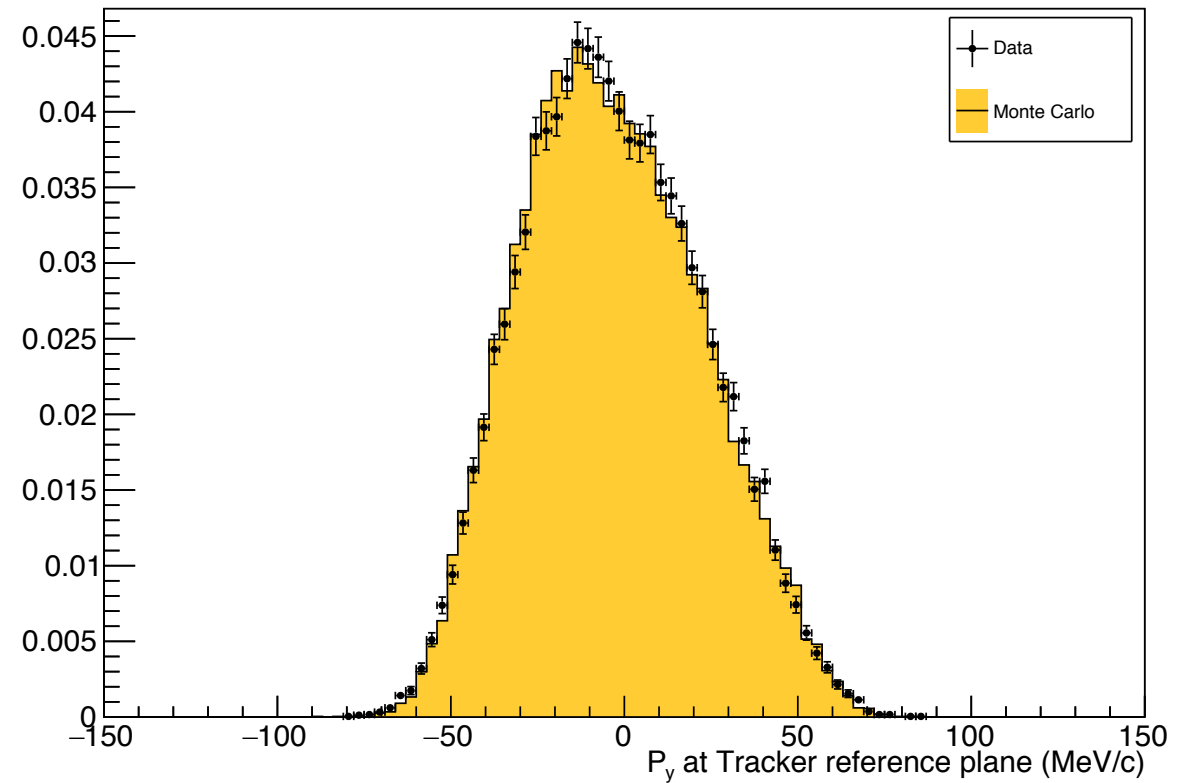

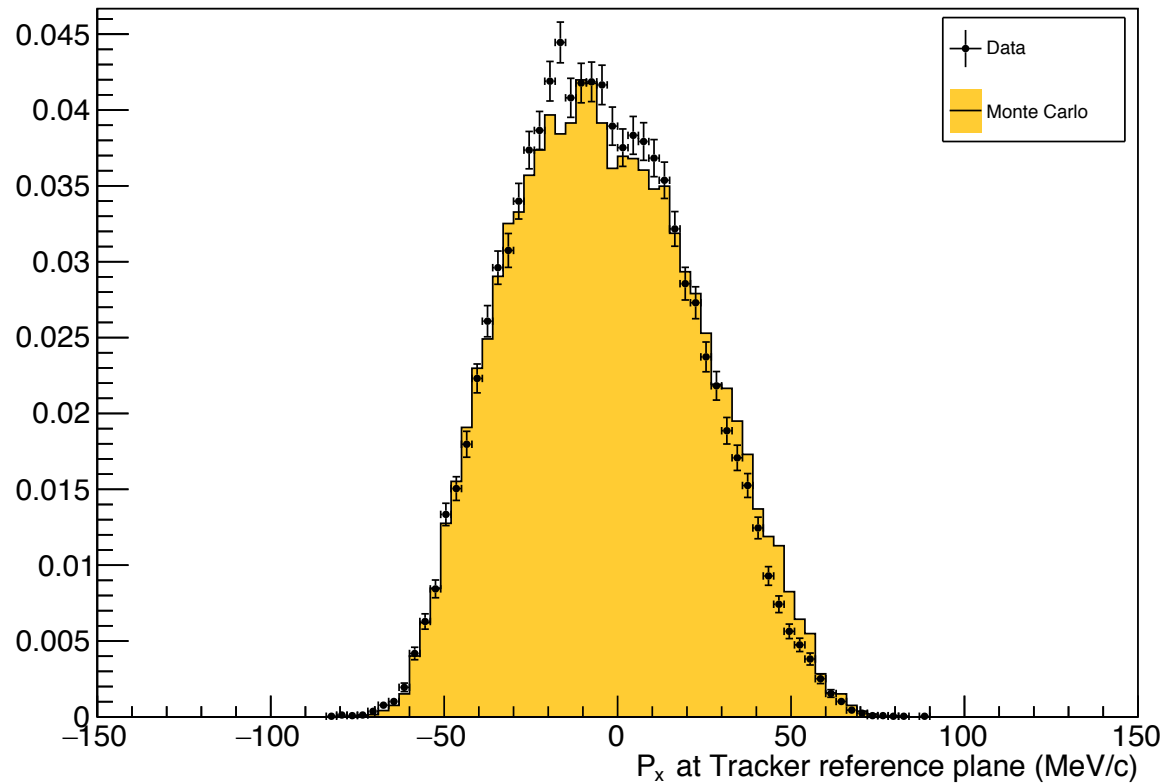

All cuts have been applied to these plots

Y

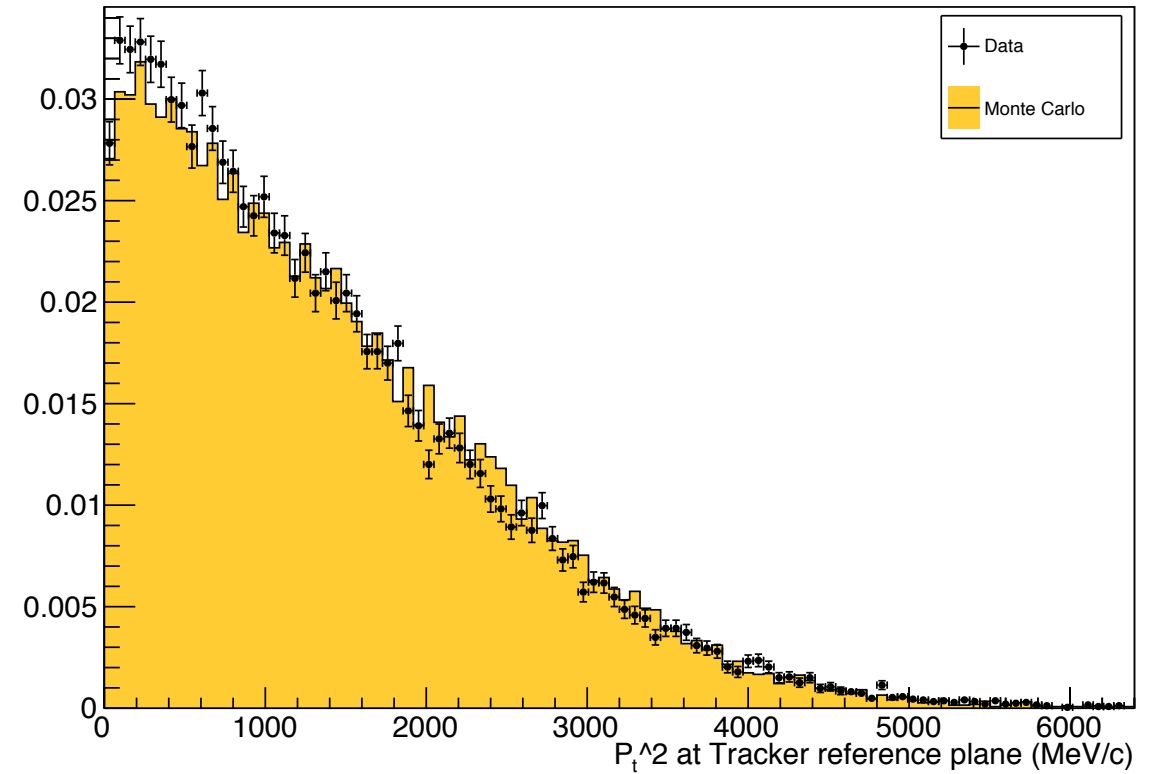

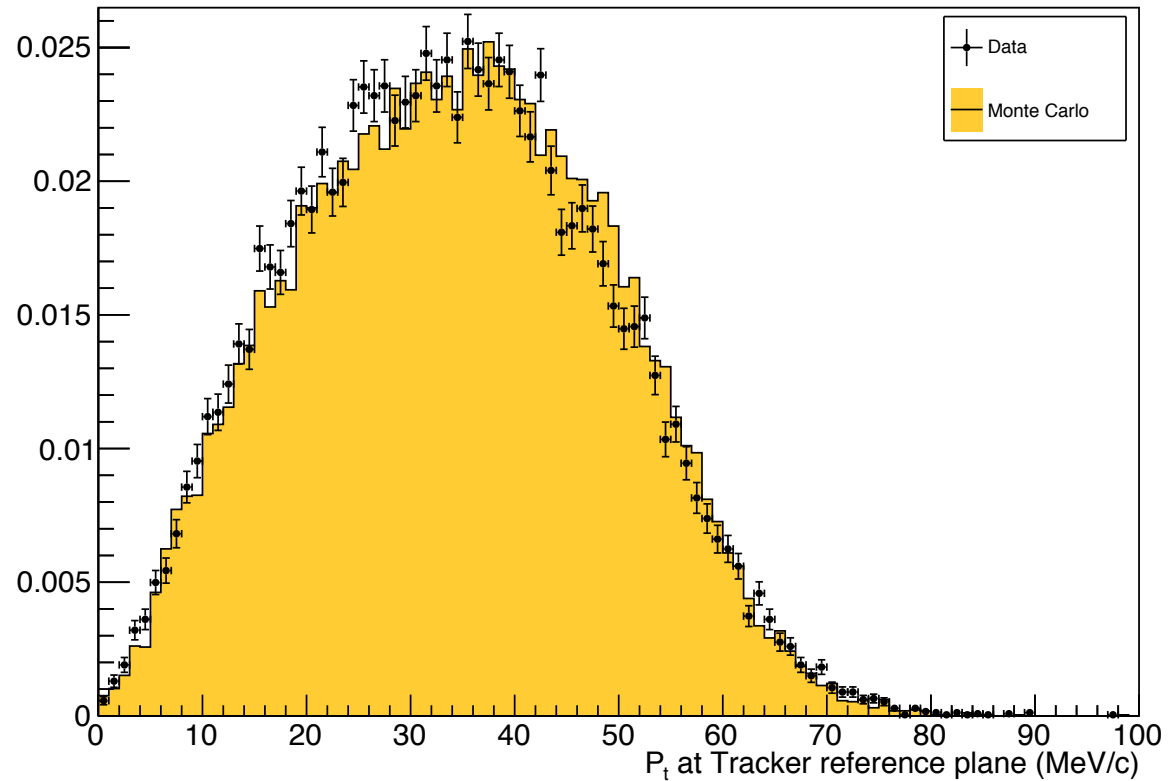

All cuts have been applied to these plots

P_X, P_Y

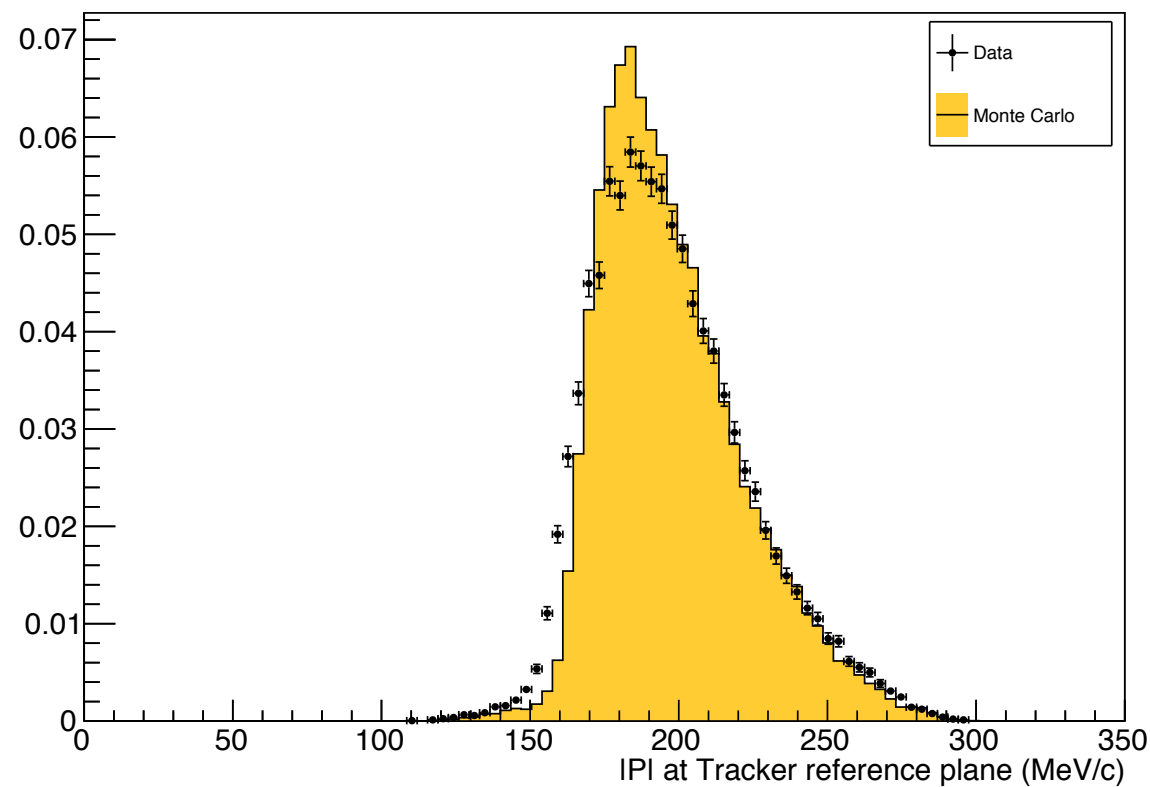

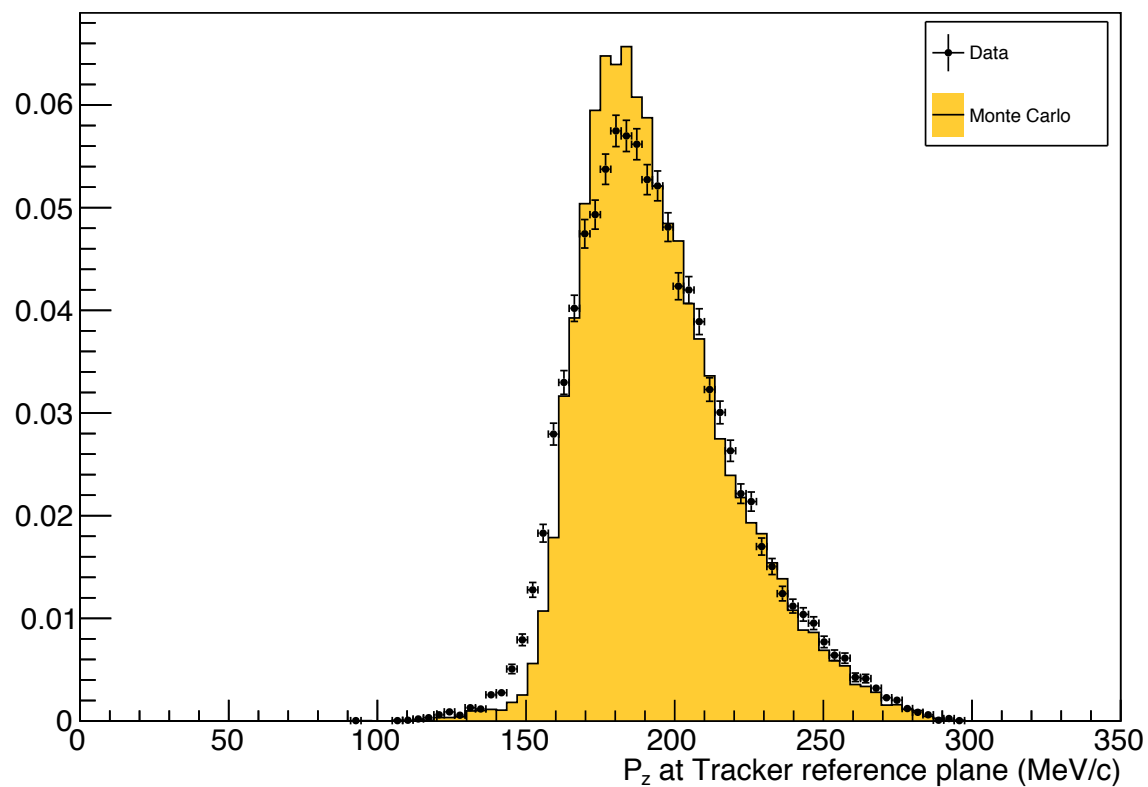

All cuts have been applied to these plots

P_T, P_T^2

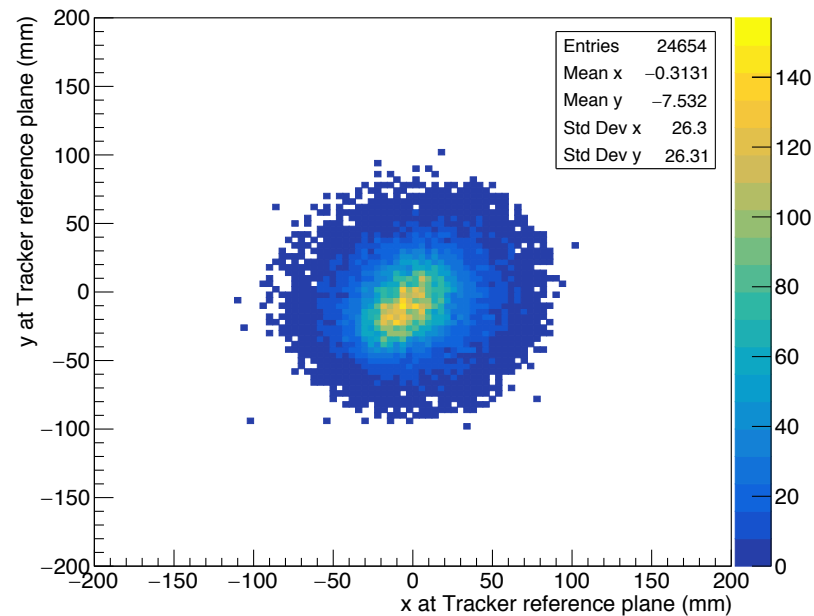

All cuts have been applied to these plots

$P_z, |P|$

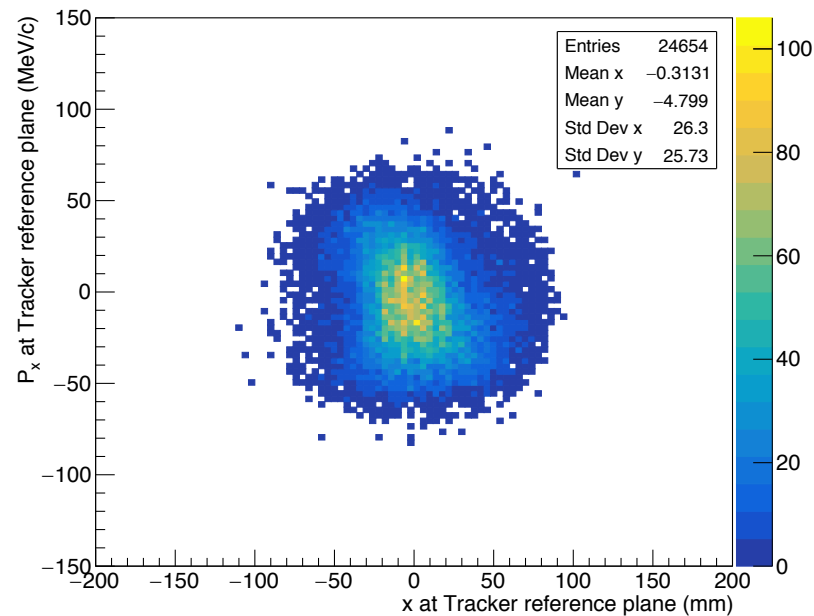

PHASE SPACE PROJECTIONS

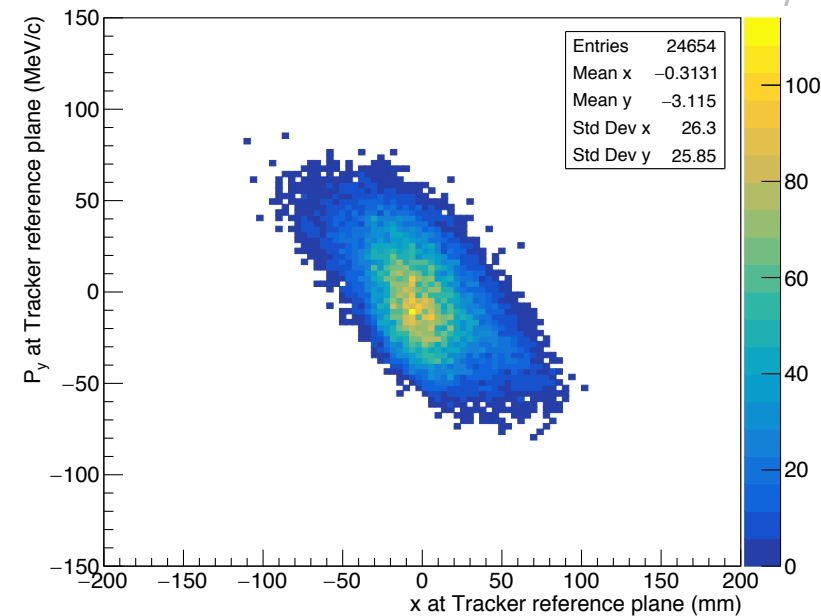

Reconstructed Data

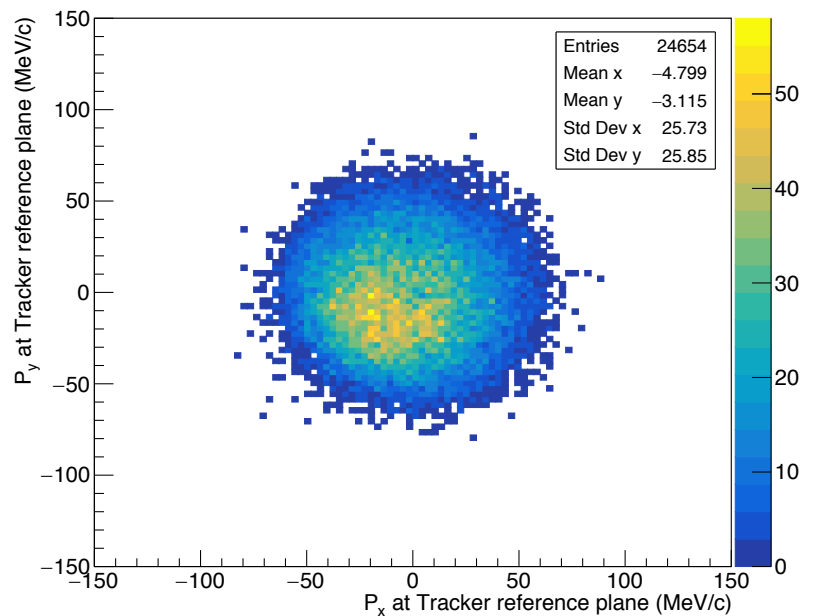

Reconstructed Data

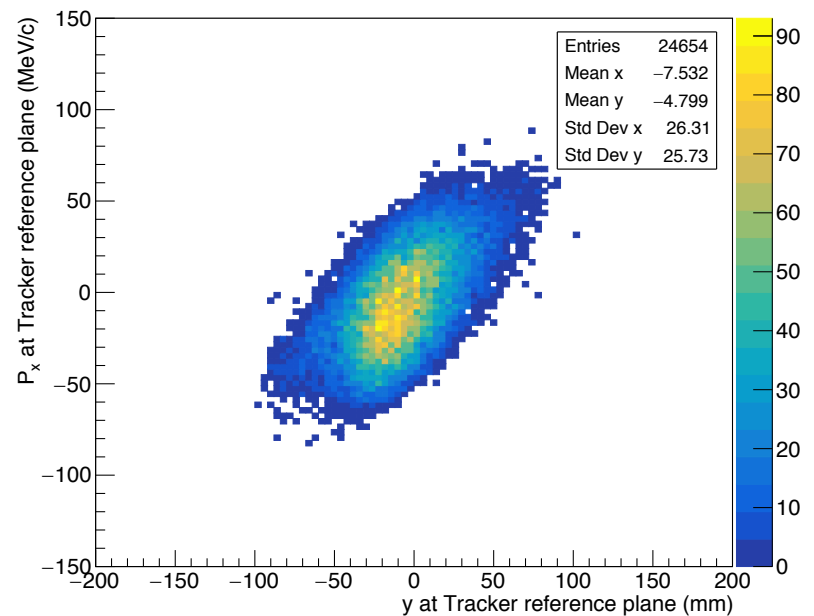

Reconstructed Data

DISPERSION

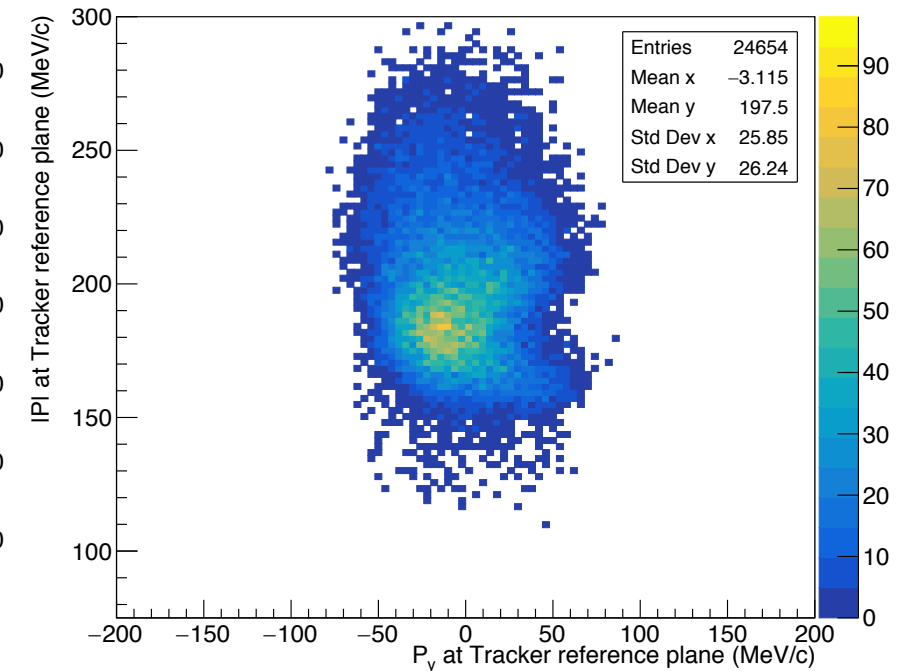

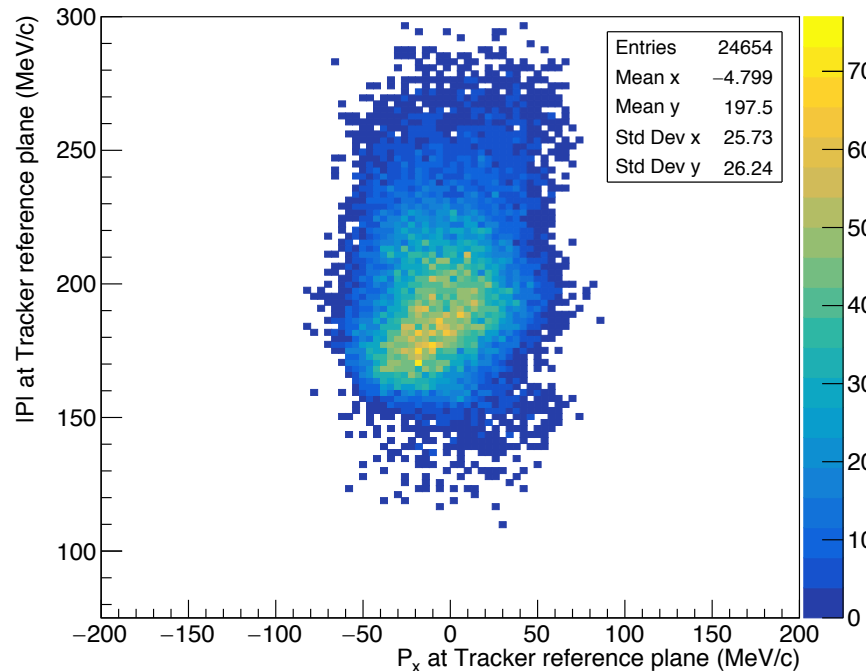

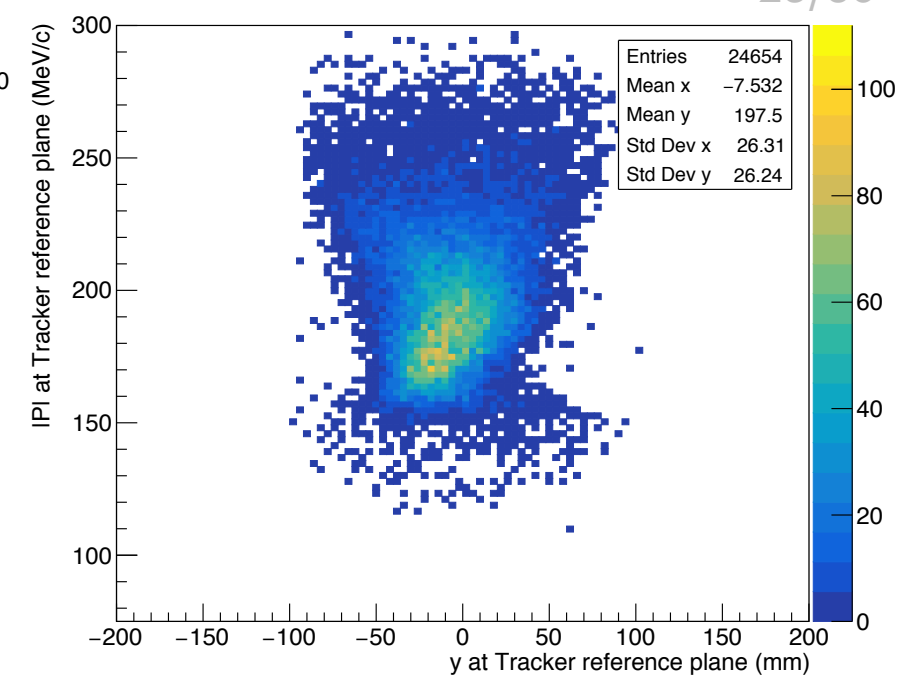

- Will look at emittance in 10 MeV slices of $|P|$
- Can make phase-space plots for each of these slices
- Can see that each slice is approx. ellipse
- Can see rotations!
- [Difficult-to-see plot coming – sorry!]

Reconstructed Data

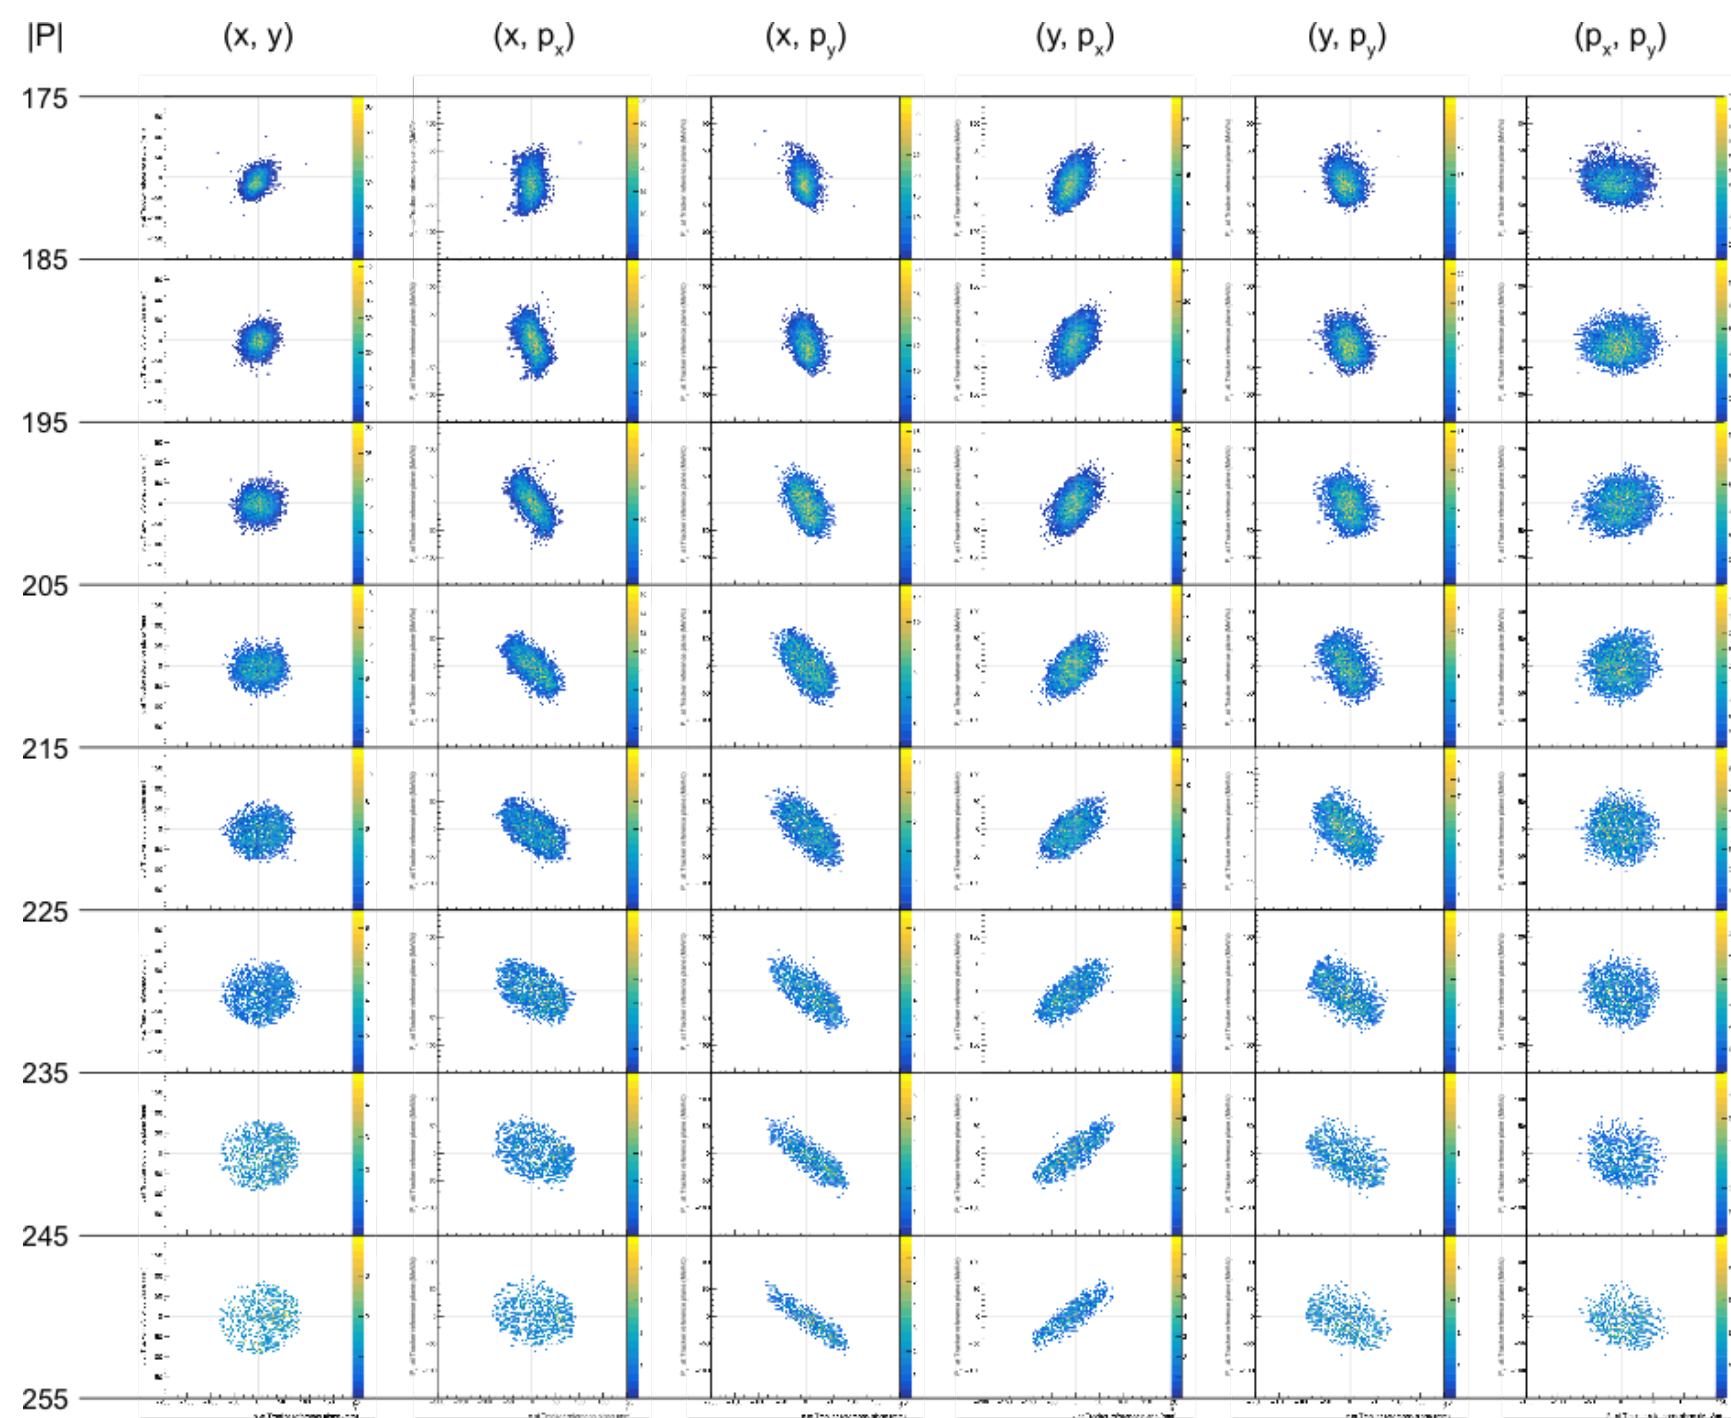

Reconstructed Data

26/30

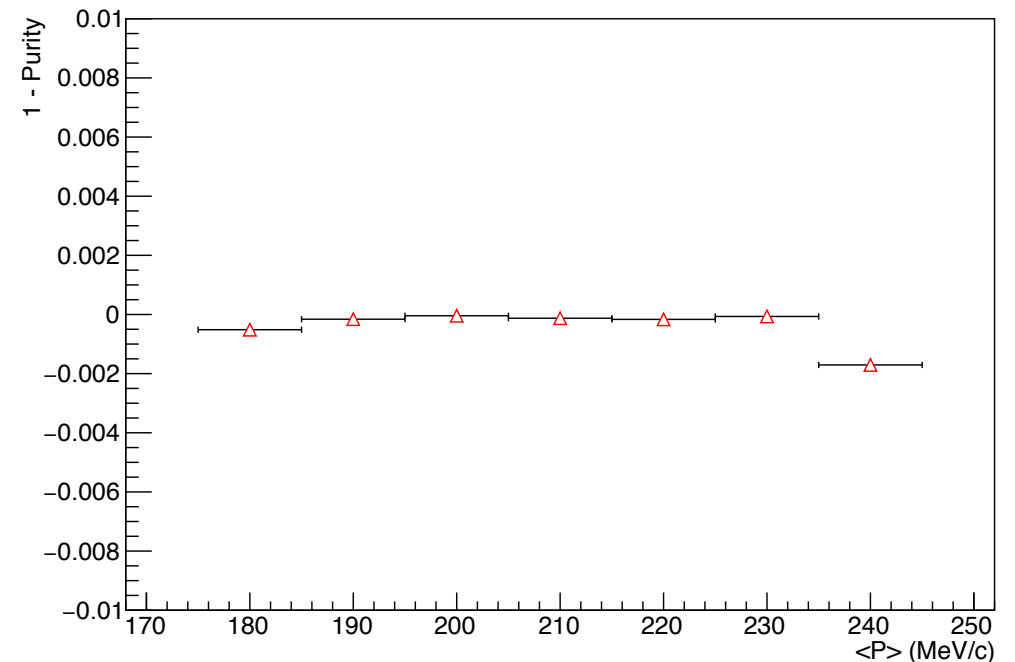

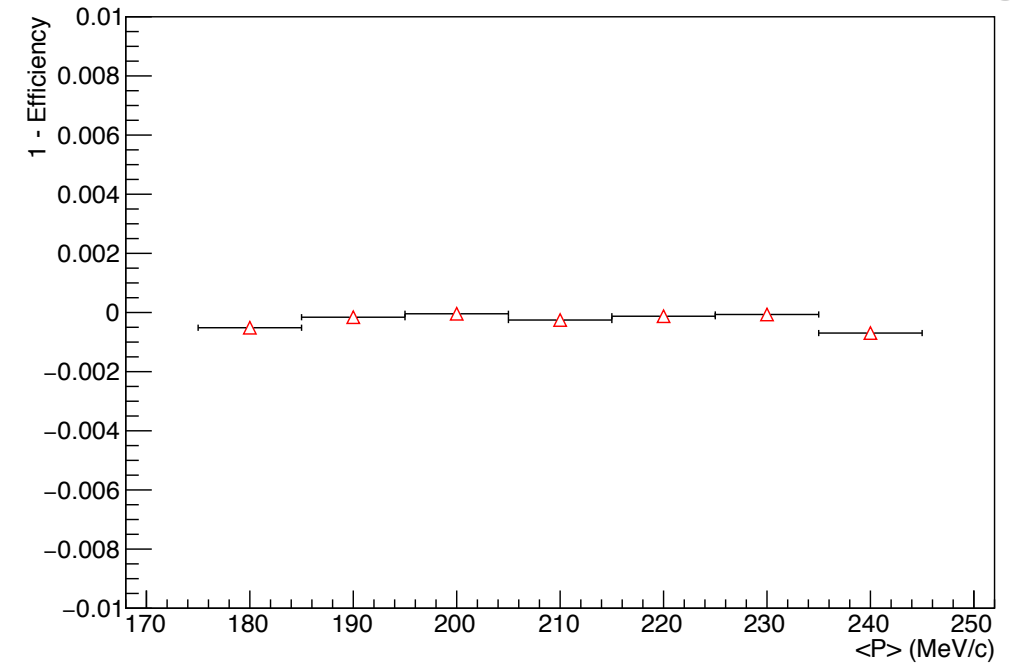

DISPERSION

- Will look at emittance in 10 MeV slices of $|P|$
- Can make phase-space plots for each of these slices
- Can see that each slice is approx. ellipse
- Can see rotations!
- [Difficult-to-see plot coming – sorry!]

EFFICIENCY, PURITY

- For each momentum bin:
 - N_G = number particles in MC truth in this bin
 - N_R = number particles in MC recon in this bin
 - N_C = number particles that were generated, reconstructed **and** passed all cuts
- Efficiency = $\frac{N_C}{N_G}$
- Purity = $\frac{N_C}{N_R}$
- Plotting 1 - quantity

UNCERTAINTY CALCULATIONS

Beam selection: Dominant contribution from diffuser aperture cut

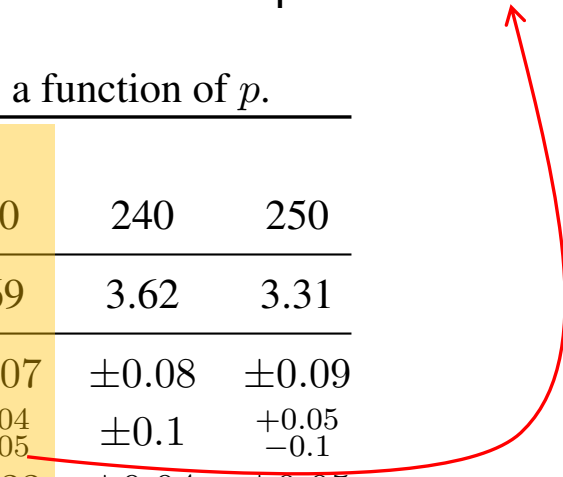

Table 3: Statistical and systematic uncertainties on the measured emittance as a function of p .

Source	$\langle p \rangle$ (MeV/c)							
	180	190	200	210	220	230	240	250
Measured emittance (mm rad)	3.06	3.40	3.65	3.69	3.65	3.69	3.62	3.31
Statistical uncertainty	± 0.03	± 0.04	± 0.04	± 0.05	± 0.05	± 0.07	± 0.08	± 0.09
Beam selection	$+0.05$ -0.04	$+0.05$ -0.04	$+0.06$ -0.05	$+0.05$ -0.06	± 0.05	$+0.04$ -0.05	± 0.1	$+0.05$ -0.1
Binning in p	± 0.02	± 0.02	± 0.02	± 0.02	± 0.03	± 0.33	± 0.04	± 0.05
Non-uniform magnetic field	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$
Low p_{\perp} tracks	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$
Tracker-field misalignment	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$
Magnetic field scale	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$	$\pm ???$
Tracker resolution	± 0.00	± 0.00	± 0.00	± 0.00	± 0.00	± 0.01	± 0.01	± 0.01
Total systematic uncertainty	$+0.06$ -0.04	$+0.06$ -0.04	$+0.07$ -0.05	± 0.06	± 0.06	± 0.34	$+0.11$ -0.10	$+0.07$ -0.11
Total uncertainty	$+0.07$ -0.05	$+0.06$ -0.05	$+0.08$ -0.07	± 0.08	± 0.08	± 0.34	$+0.14$ -0.13	$+0.12$ -0.14
Total uncertainty (%)	$+2.14$ -1.71	$+1.98$ -1.60	$+2.17$ -1.85	$+2.06$ -2.20	$+2.29$ -2.25	$+9.29$ -9.31	$+3.89$ -3.54	$+3.49$ -4.32

Suspicious bin – big track error outliers?

EMITTANCE COMPARISON

- Statistical uncertainty from data or MC
- Systematic uncertainty from data
- Summed in quadrature
- 230 MeV bin is suspicious
- For field systematic uncertainty
→ C. Hunt
- Just a few things left...
 - Field systematics
 - Diffuser problem?
 - Suspect bin?
