Medical Physics

=

A branch of applied physics concerning the application of physics to medicine

or, in other words

The application of physics techniques to the human health

Outline of the lecture

Physics discoveries

Tools for physics applied to medicine

Medical imaging

X-ray CT

PET and PET/CT

Photon/electron radiation therapy

Hadron therapy

Outline of the lecture

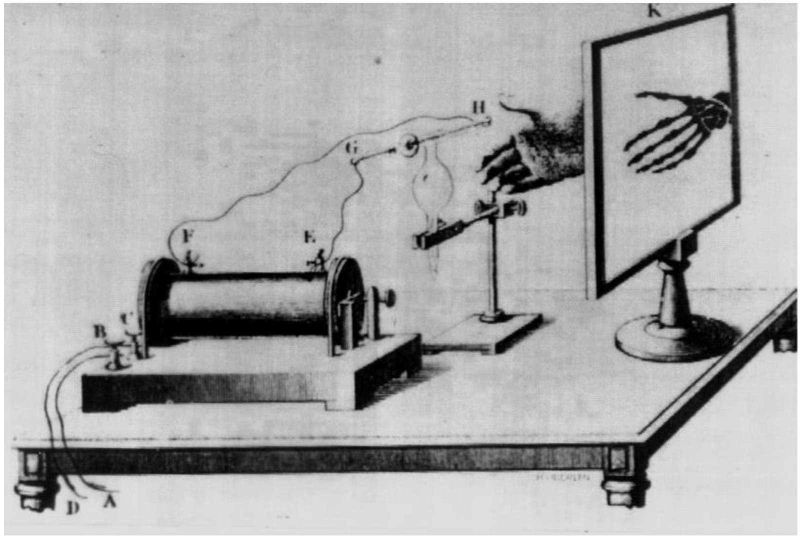
Photon/electron radiation therapy

Hadron therapy

The beginnings of modern physics and of medical physics



1895

Discovery of X rays

Wilhelm C. Röntgen

1897

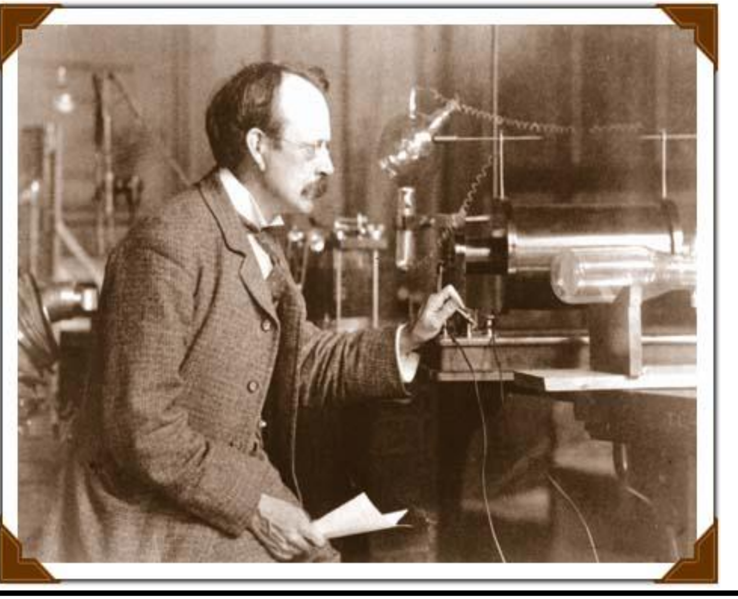
First treatment of tissue with X rays

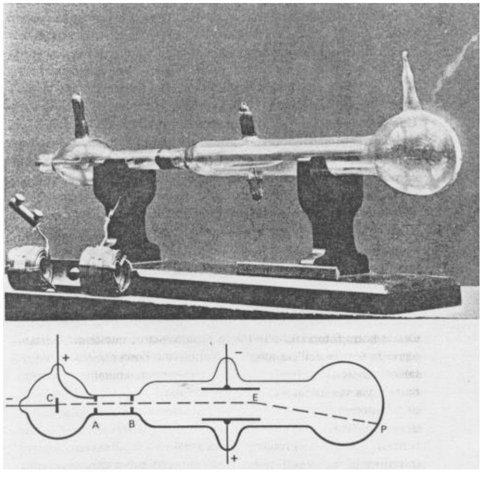
Leopold Freund

J.J. Thompson

1897

“Discovery” of the electron





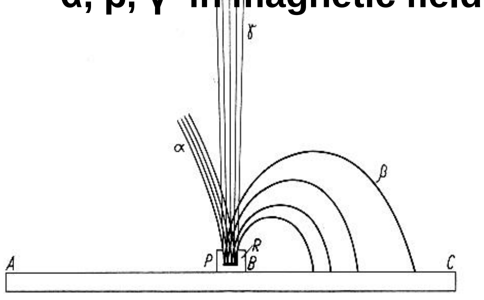
Henri Becquerel
(1852-1908)

1896

Discovery of natural radioactivity

Thesis of Mme. Curie – 1904

α, β, γ in magnetic field



Hundred years ago

1898

Discovery of polonium and radium

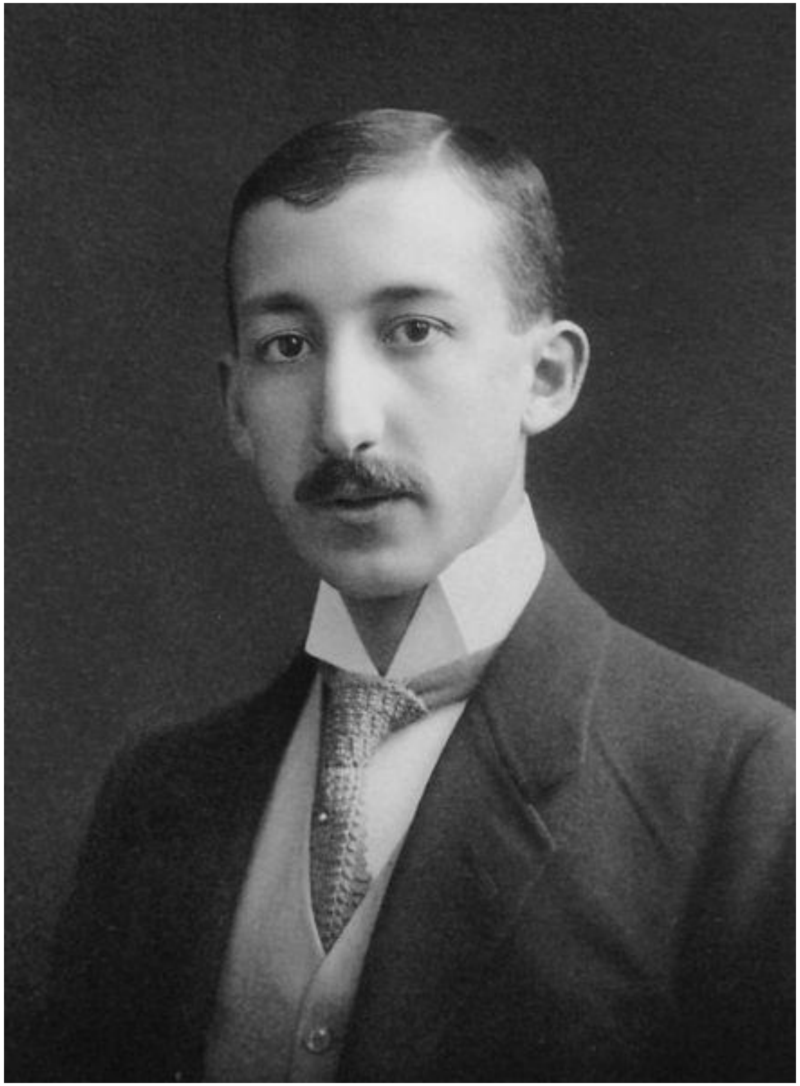
Marie Curie
(1867 – 1934)

Pierre Curie
(1859 – 1906)

First practical application of a radioisotope

- 1911: **first practical application of a radioisotope** (as *radiotracer*) by G. de Hevesy (a young Hungarian student working with naturally radioactive materials) in Manchester

- 1924: de Hevesy, who had become a physician, used radioactive isotopes of lead as tracers in bone studies

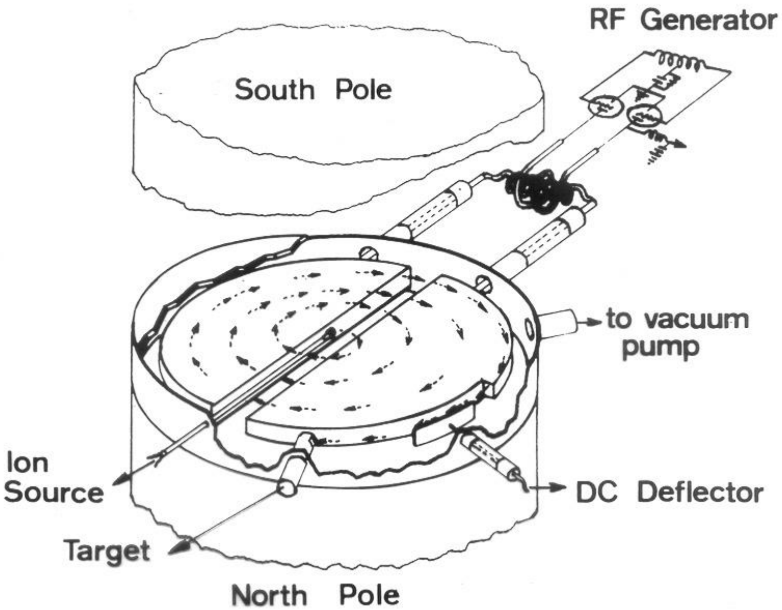


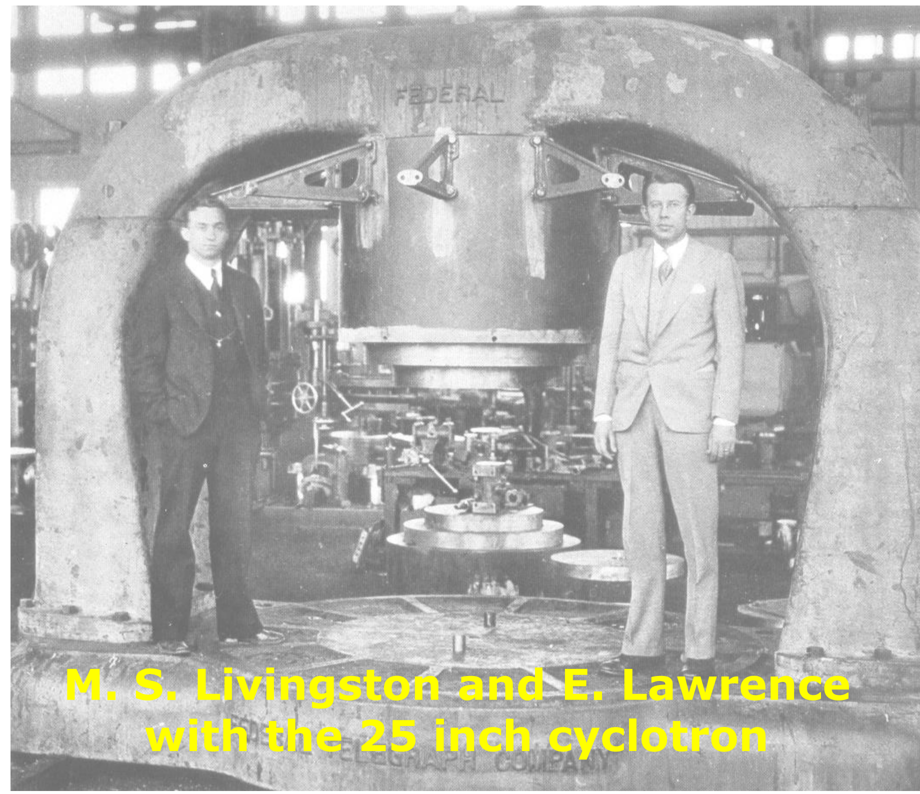
Tools for (medical) physics: the cyclotron

1930

Invention of the cyclotron

Ernest Lawrence





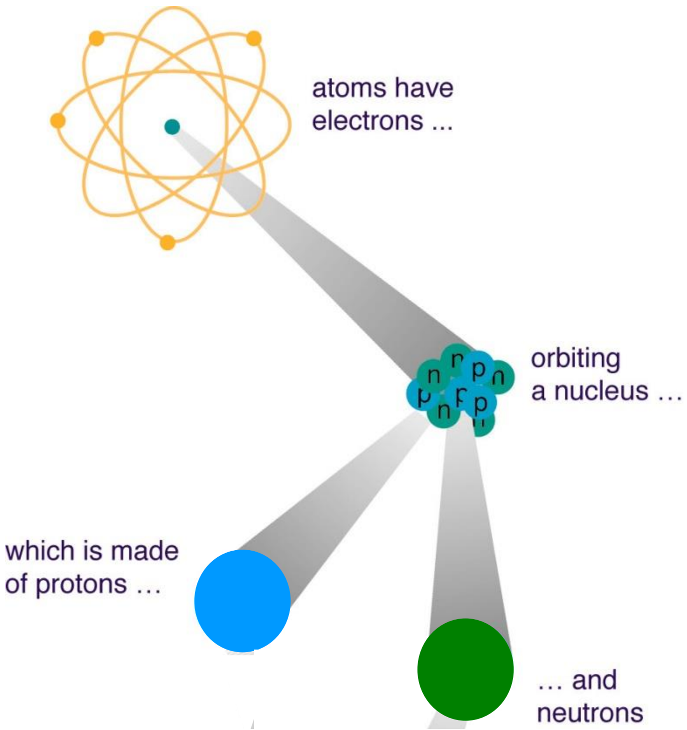
M. S. Livingston and E. Lawrence with the 25 inch cyclotron

James Chadwick

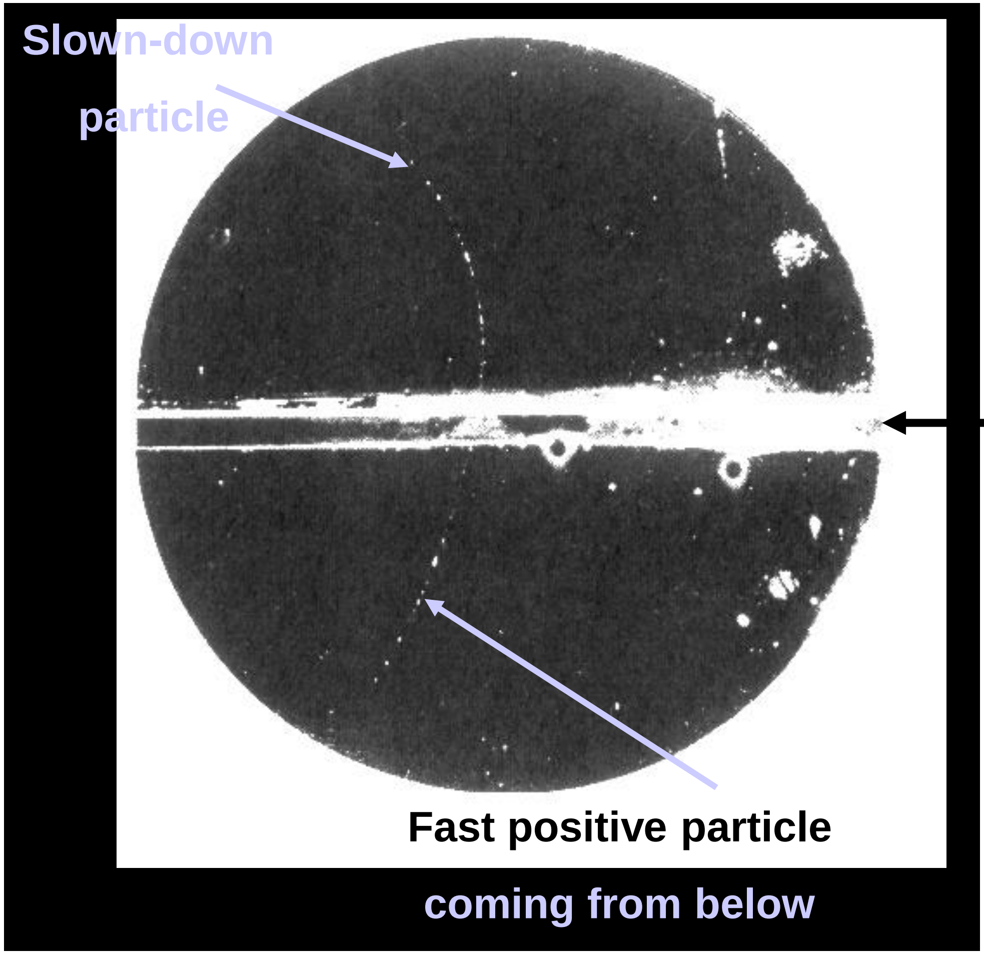
(1891 – 1974)

1932

Discovery of the neutron



Cyclotron + neutrons = first attempt of radiation therapy with fast neutrons at LBL (R. Stone and J. Lawrence, 1938)



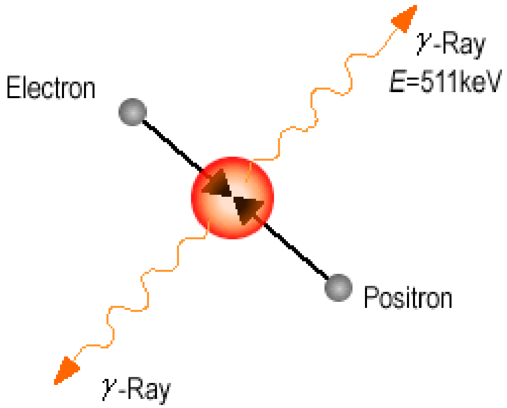
1932

Discovery of the positron

C. D. Anderson

Layer of lead

Inserted in a cloud chamber



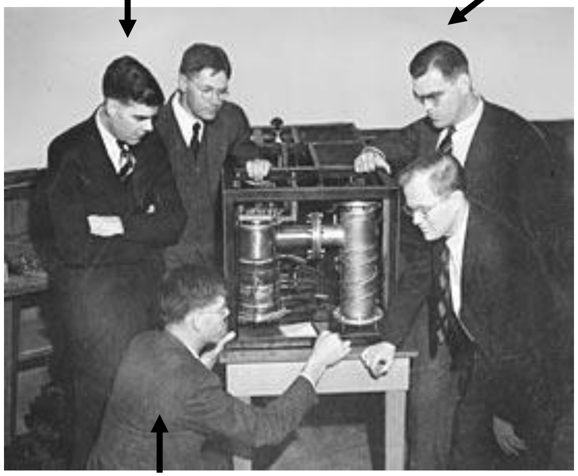
Historical development of radioisotopes for medicine

- 1932: the invention of the cyclotron by E. Lawrence makes it possible to produce radioactive isotopes of a number of biologically important elements
- 1941: first medical cyclotron installed at Washington University, St Louis, for the production of radioactive isotopes of phosphorus, iron, arsenic and sulphur
- After WWII: following the development of the fission process, most radioisotopes of medical interest begin to be produced in nuclear reactors
- 1951: Cassen et al. develop the concept of the rectilinear scanner
- 1957: the ^{99}Mo/^{99m}Tc generator system is developed by the Brookhaven National Laboratory
- 1958: production of the first gamma camera by Anger, later modified to what is now known as the Anger scintillation camera, still in use today

Tools for (medical) physics: the electron linac

Sigmur Varian

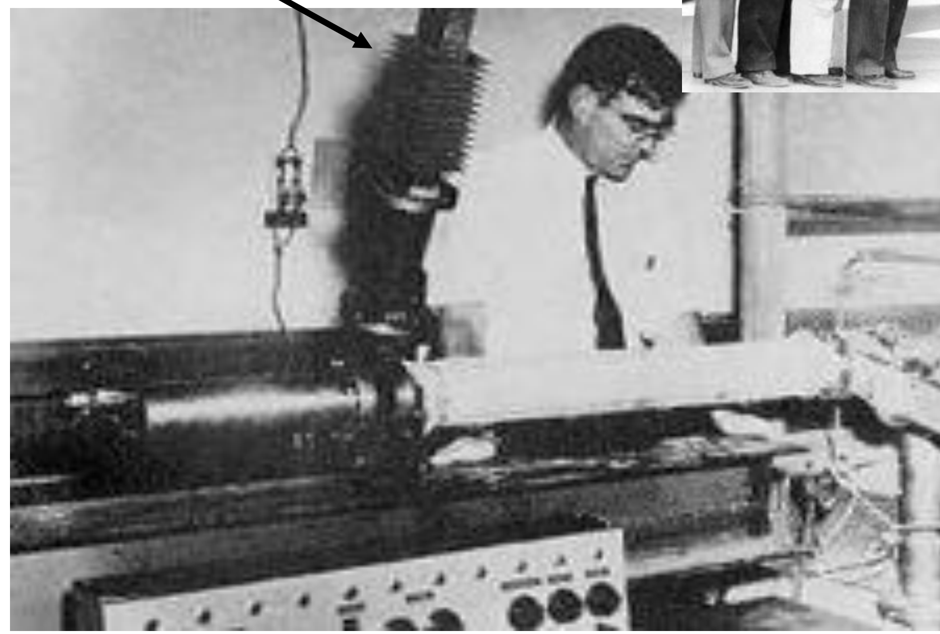
William W. Hansen



Russell Varian

1939

Invention of the klystron



1947
first linac for electrons
4.5 MeV and 3 GHz

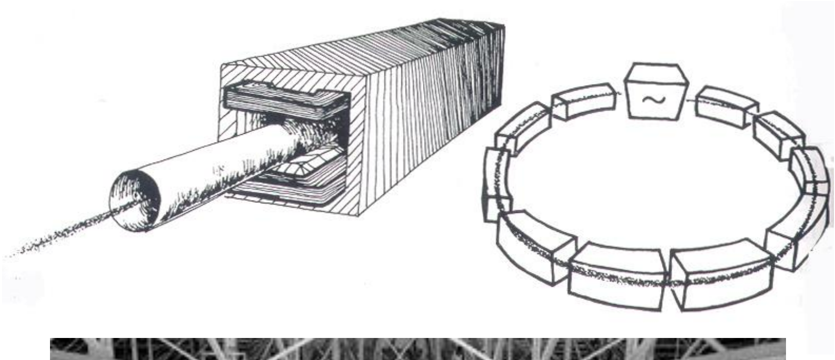
1950's: development of compact linear electron accelerators by various companies

Tools for (medical) physics: the synchrotron

1945: E. McMillan and V.J.Veksler

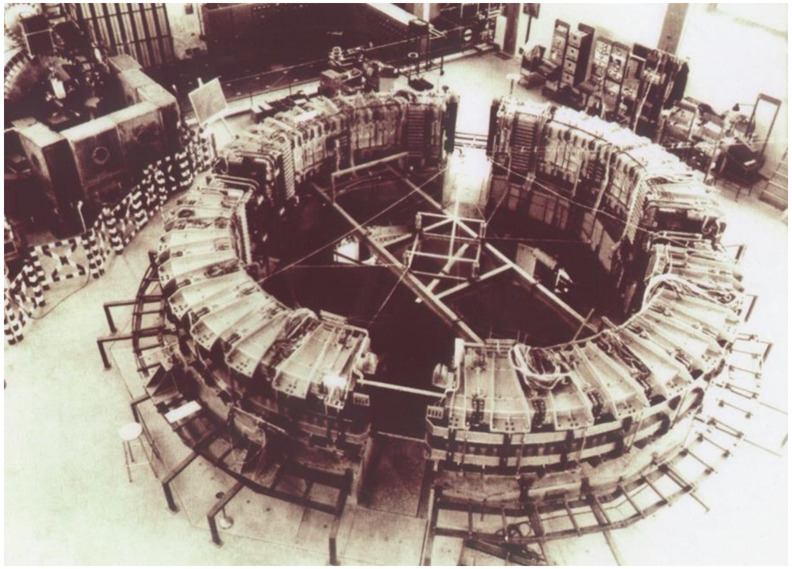
discover the

principle of phase stability



1 GeV electron synchrotron

Frascati - INFN - 1959

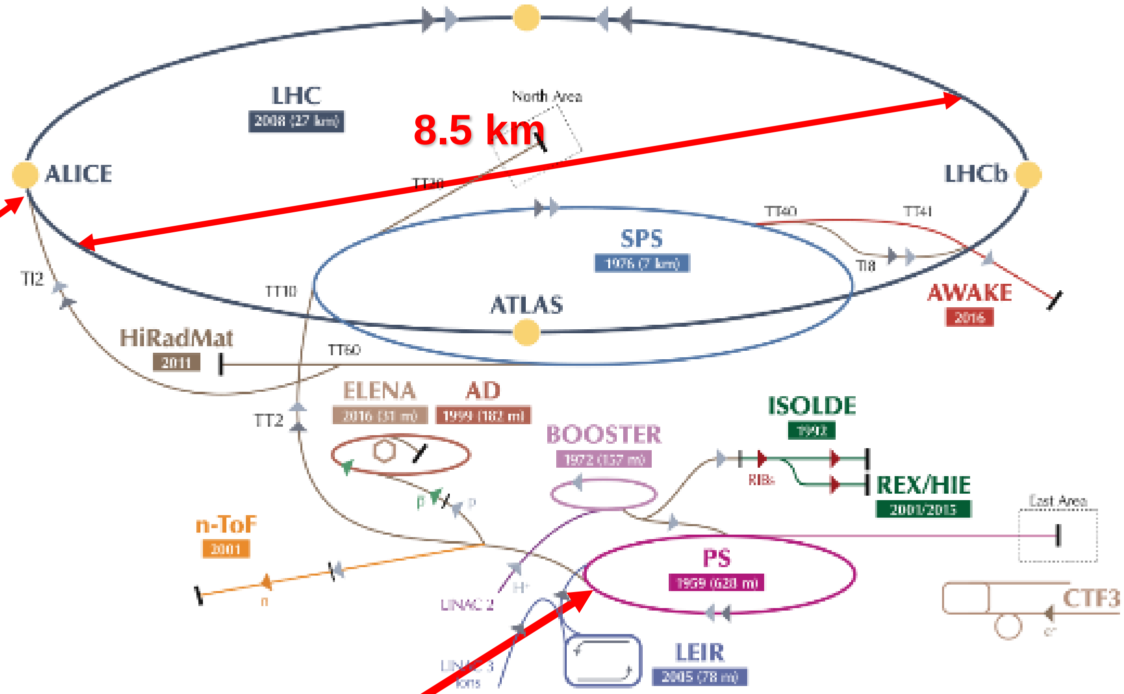


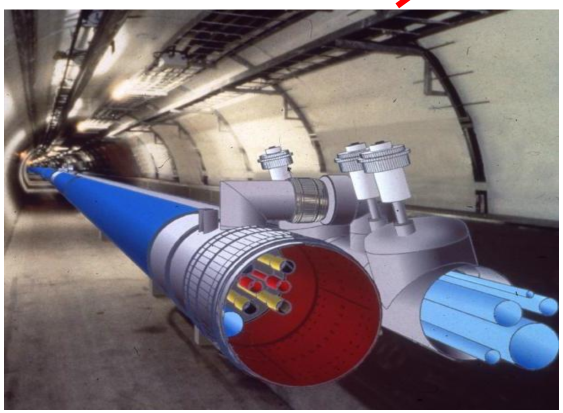
6 GeV proton synchrotron

Bevatron - Berkeley - 1954

CERN accelerators

Large Hadron Collider
7 TeV + 7 TeV
Start in 2008





The PS in 1959

In 1952 the “strong-focusing” method invented at BNL (USA) was chosen for the CERN PS

Photon/electron radiation therapy

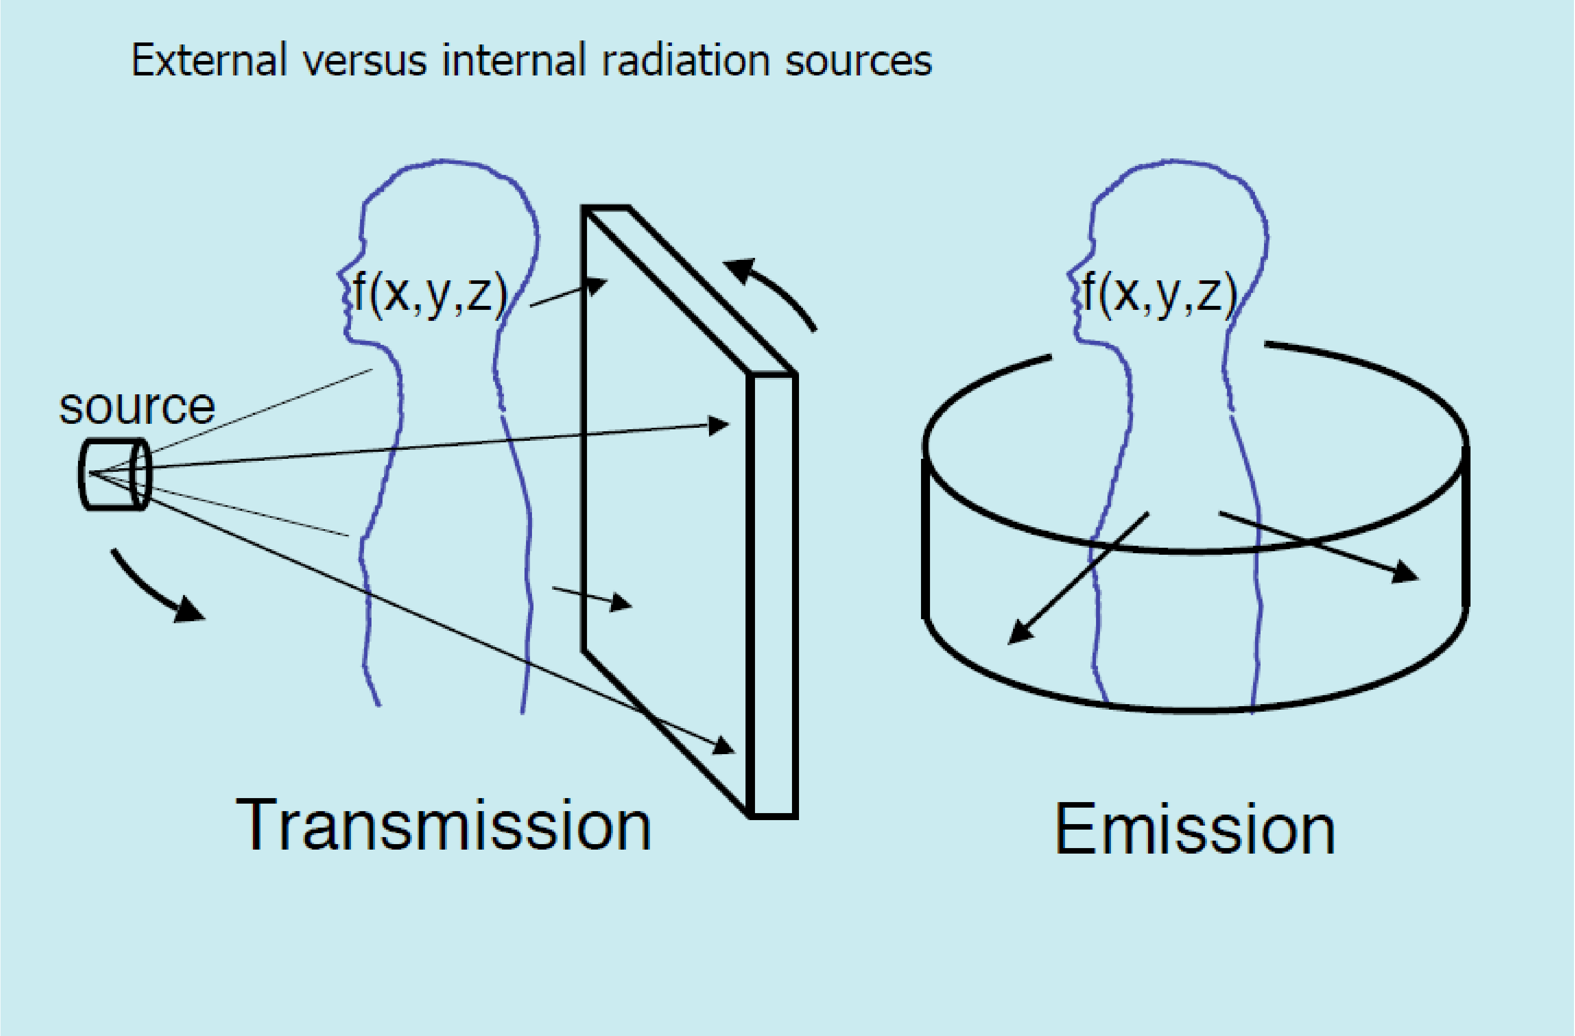
Hadron therapy

Medical imaging

TECHNIQUE		YEAR	ENERGY	PHYSICAL PROPERTY	IMAGING
RADIOLOGY	X RAYS IMAGING	**1895**	X RAYS	ABSORPTION	
ECHOGRAPHY	ULTRASOUND IMAGING	1950	US	REFLECTION TRANSMISSION	
NUCLEAR MEDICINE	RADIOISOTOPE IMAGING	1950	γ RAYS	RADIATION EMISSION	
Medical imaging

TECHNIQUE		YEAR	ENERGY	PHYSICAL PROPERTY	IMAGING	
X RAYS COMPUTERIZED TOMOGRAPHY	**CT**	**1971**	X RAYS	ABSORPTION		MORPHOLOGY
MAGNETIC RESONANCE IMAGING	MRI	1980	RADIO WAVES	MAGNETIC RESONANCE		MORPHOLOGY /FUNCTION
POSITRON EMISSION TOMOGRAPHY	PET	1973	γ RAYS	RADIATION EMISSION		FUNCTION

Emission versus transmission imaging



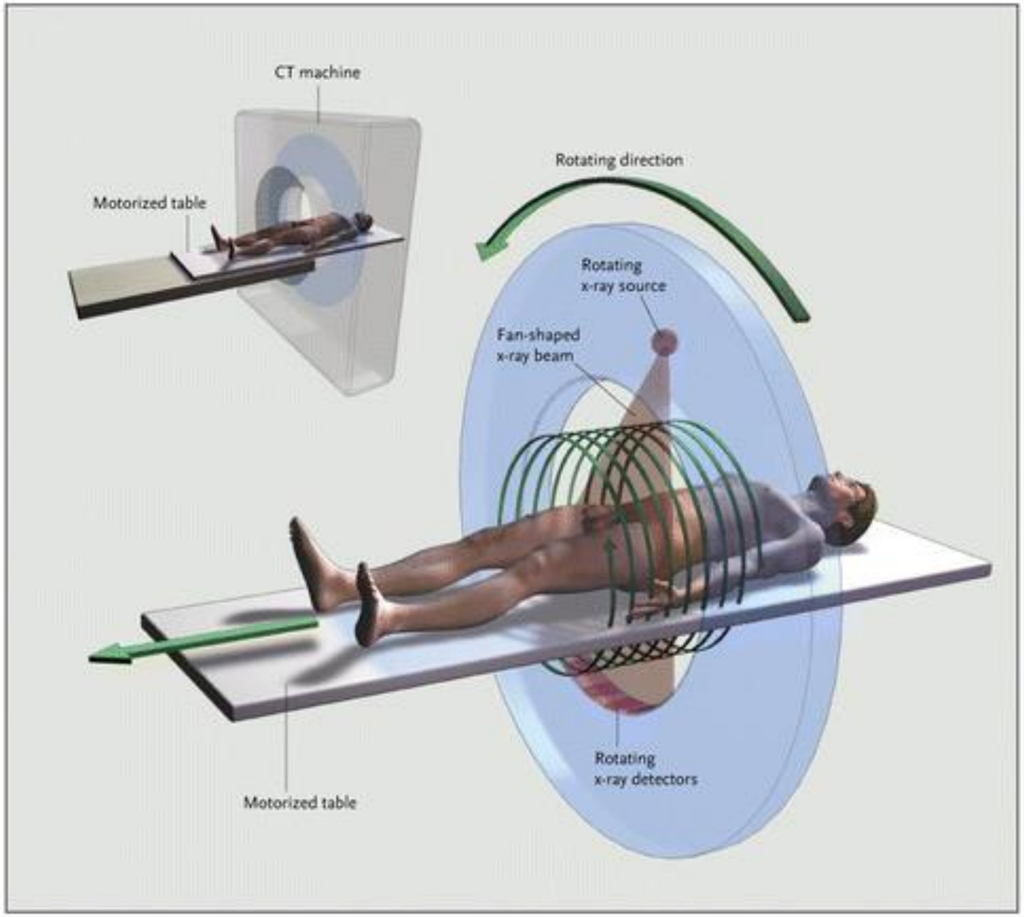
X-ray image versus CT scan

A conventional X-ray image is basically a shadow: you shine a “light” on one side of the body, and a piece of film on the other side registers the silhouette of the bones (to be more precise, organs and tissues of different densities show up differently on the radiographic film).

Shadows give an incomplete picture of an object's shape.

Look at the wall, not at the person. If there's a lamp in front of the person, you see the silhouette holding the banana, but not the pineapple as the shadow of the torso blocks the pineapple. If the lamp is to the left, you see the outline of the pineapple, but not the banana.

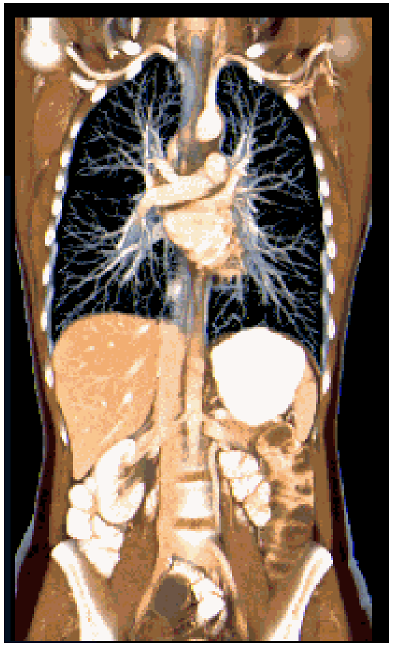
Computed tomography

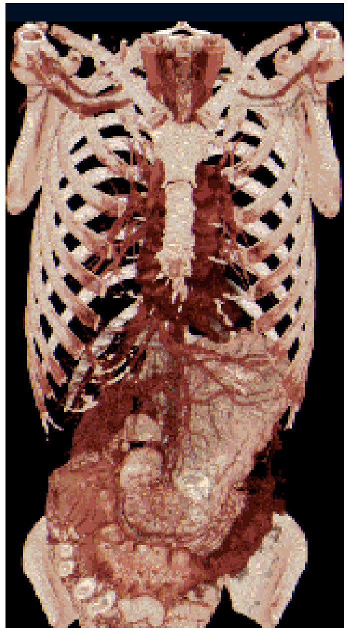


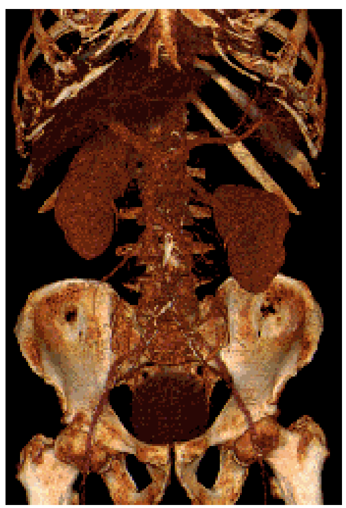
- The X-rays source rotates around the longitudinal axis of the body: it moves 360° around the patient, scanning from hundreds of different angles
- Opposite to the x-ray source, a series of detectors measure the radiation emerging from the body
- Each rotation scans a different body slice
- The couch moves to scan the next slice
- A computer analyses the data and reconstructs the **3D image** through mathematical algorithms.

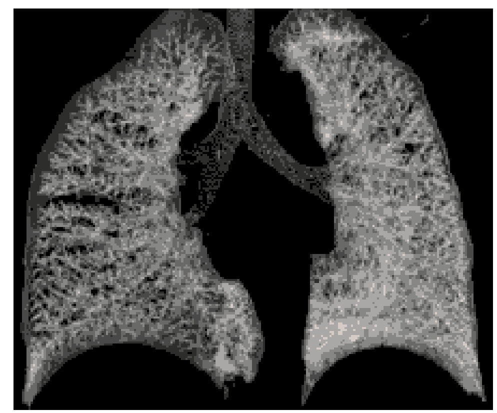
Volumetric CT

< 0.4 sec/rotation
Organ in a sec (17 cm/sec)
Whole body < 10 sec

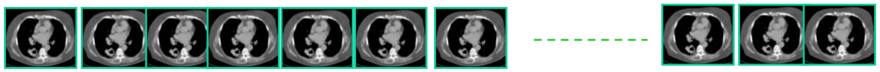




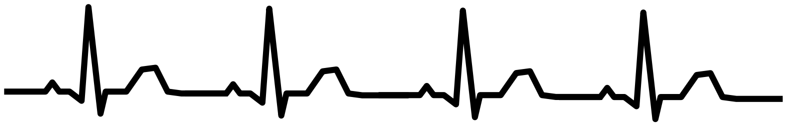




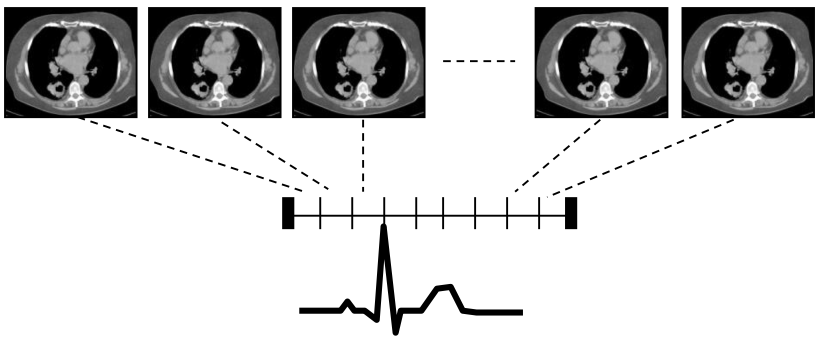
Cardiac CT



DYNAMIC CT ACQUISITION

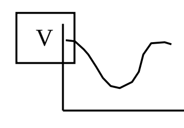


ECG

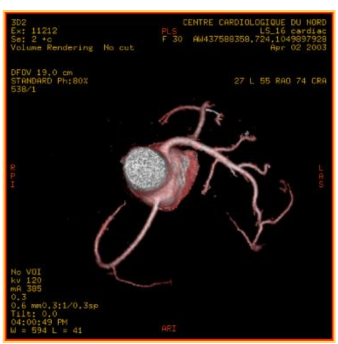


PHASES OF A CARDIAC CYCLE

- EJECTION FRACTION
- CARDIAC OUTPUT
- REGIONAL WALL MOTION
- ..



FUNCTIONAL PARAMETERS



VOLUME RENDERED IMAGE OF HEART AND VESSELS

All radionuclides commonly administered to patients in nuclear medicine are *artificially* produced

Three production routes:

- (n, γ) reactions (**nuclear reactor**): the resulting nuclide has the same chemical properties as those of the target nuclide
- Fission (**nuclear reactor**) followed by separation
- Charged particle induced reaction (**cyclotron**): the resulting nucleus is usually that of a different element

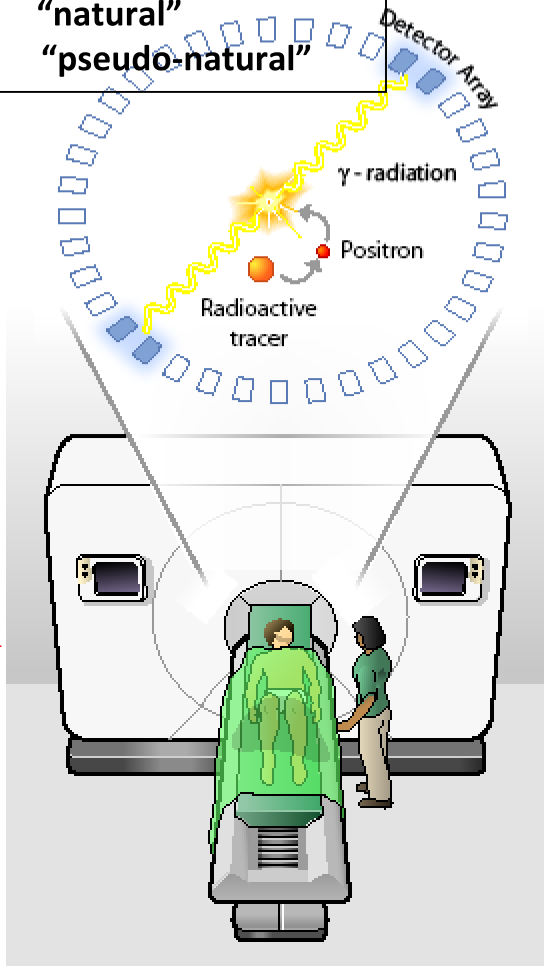
Positron Emission Tomography (PET)

ISOTOPES	Half-Life	
11-C	20.4 min,	“natural”
13-N	10.0 min	“natural”
15-O	2.0 min	“natural”
18-F	109.8 min	“pseudo-natural”

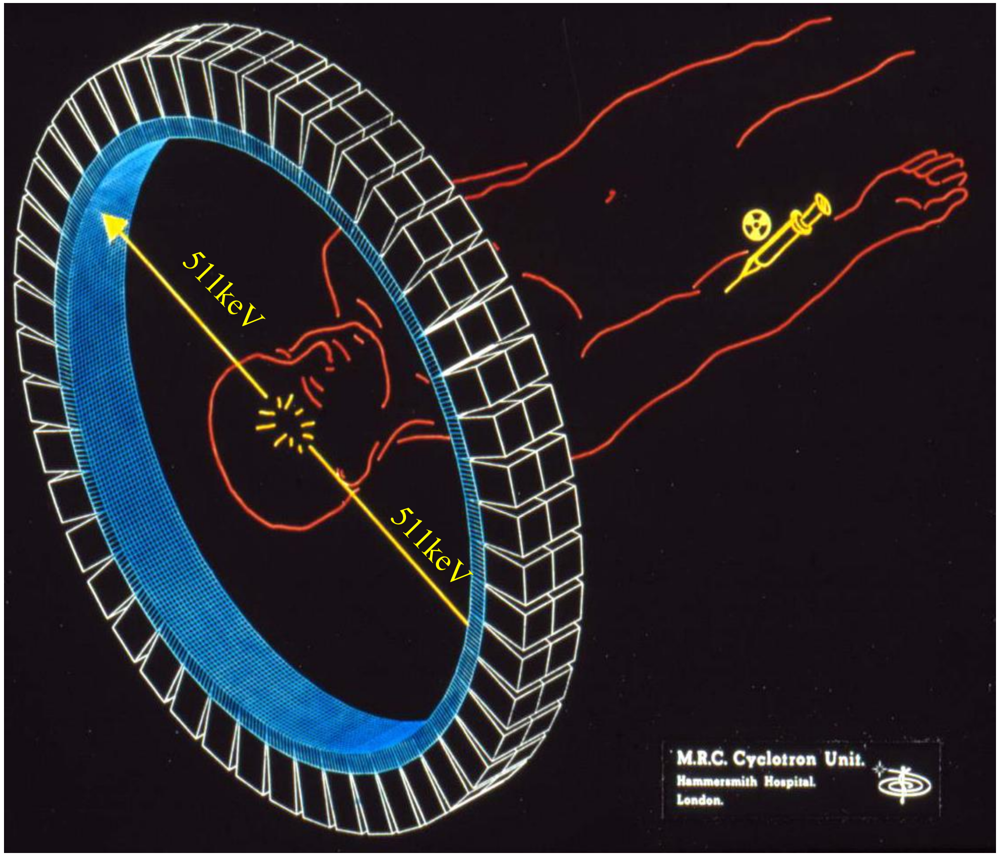
Cyclotron

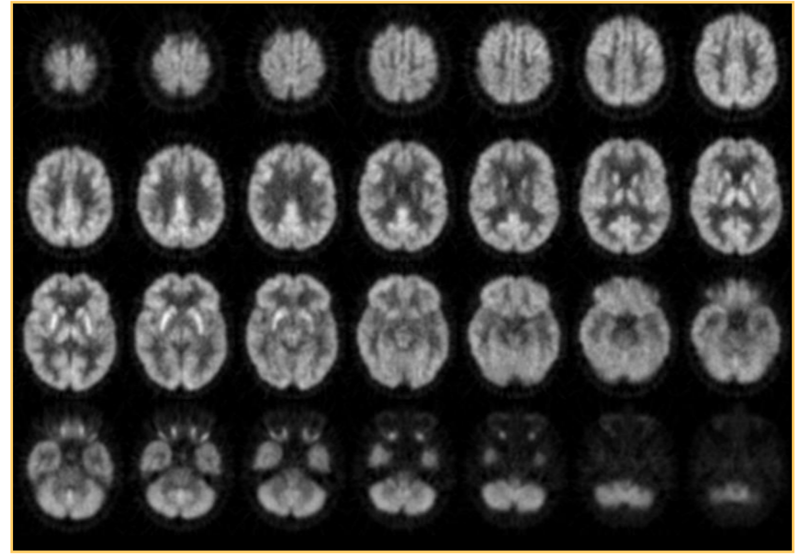
Radiochemistry

PET camera



Positron Emission Tomography (PET)





COVERAGE:
~ 15-20 cm
SPATIAL RESOLUTION:
~ 5 mm
SCAN TIME to cover an entire organ:
~ 5 min
CONTRAST RESOLUTION:
depends on the radiotracer

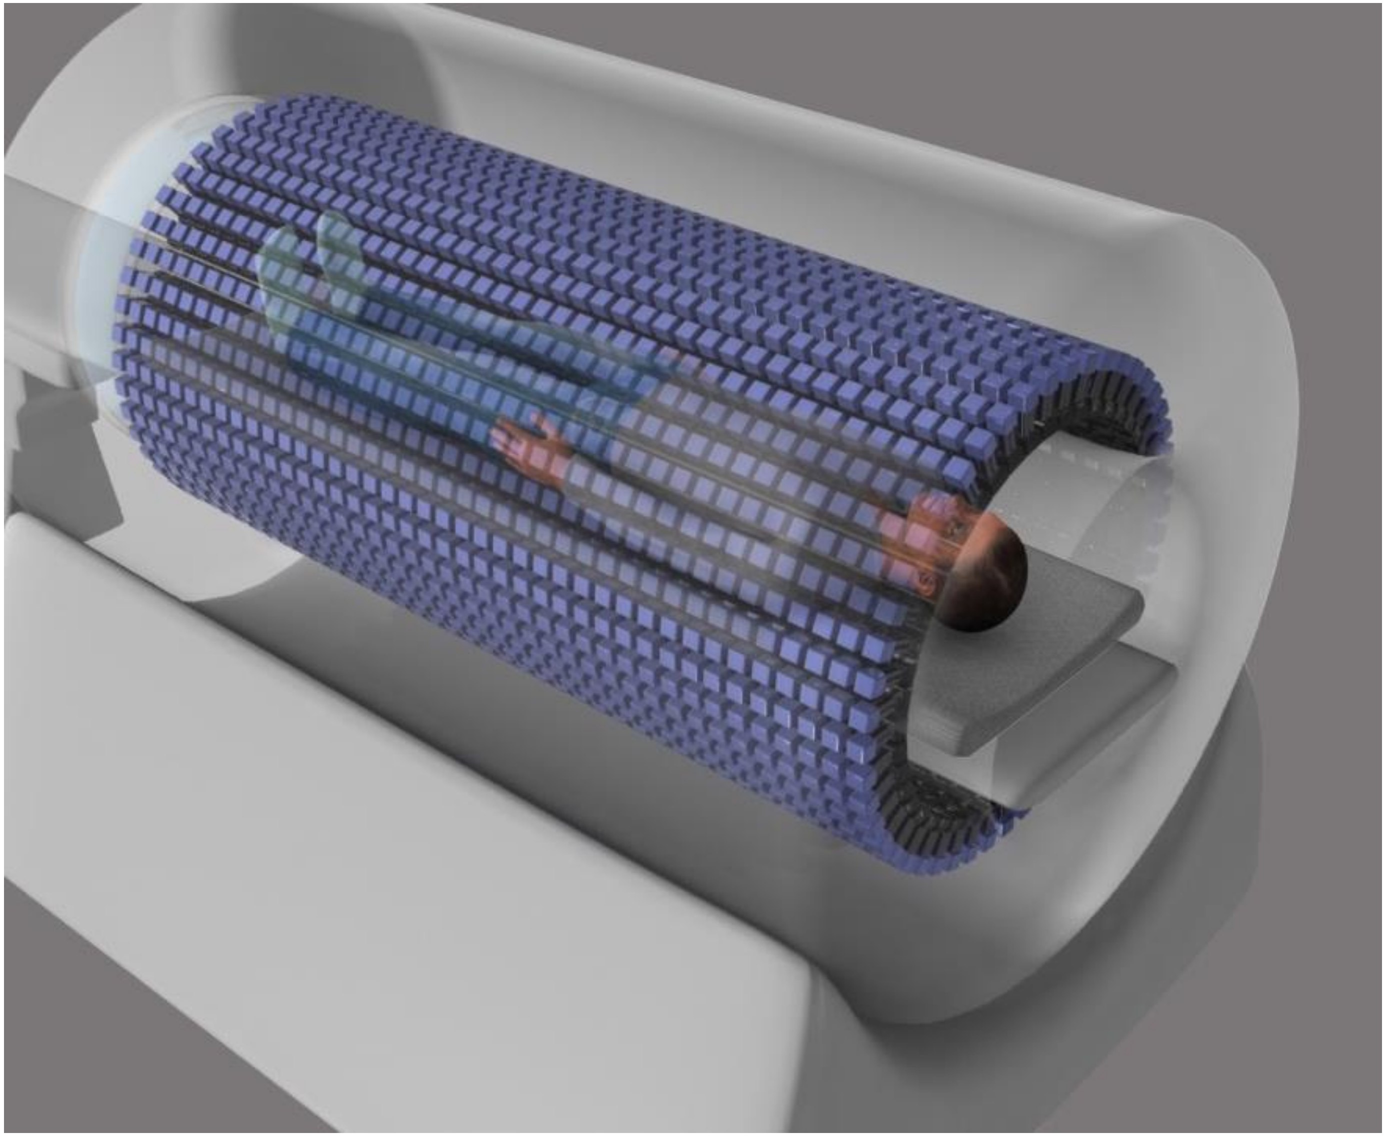
The future of PET?



Outline of the lecture

Physics discoveries

Tools for physics applied to medicine

Medical imaging

X-ray CT

PET and PET/CT

Photon/electron radiation therapy

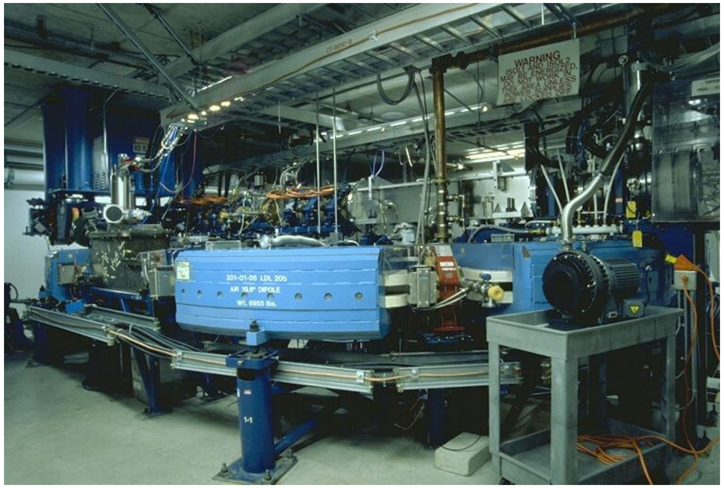
Hadron therapy

Three classes of medical accelerators

Electron linacs for conventional radiation therapy, including advanced modalities:

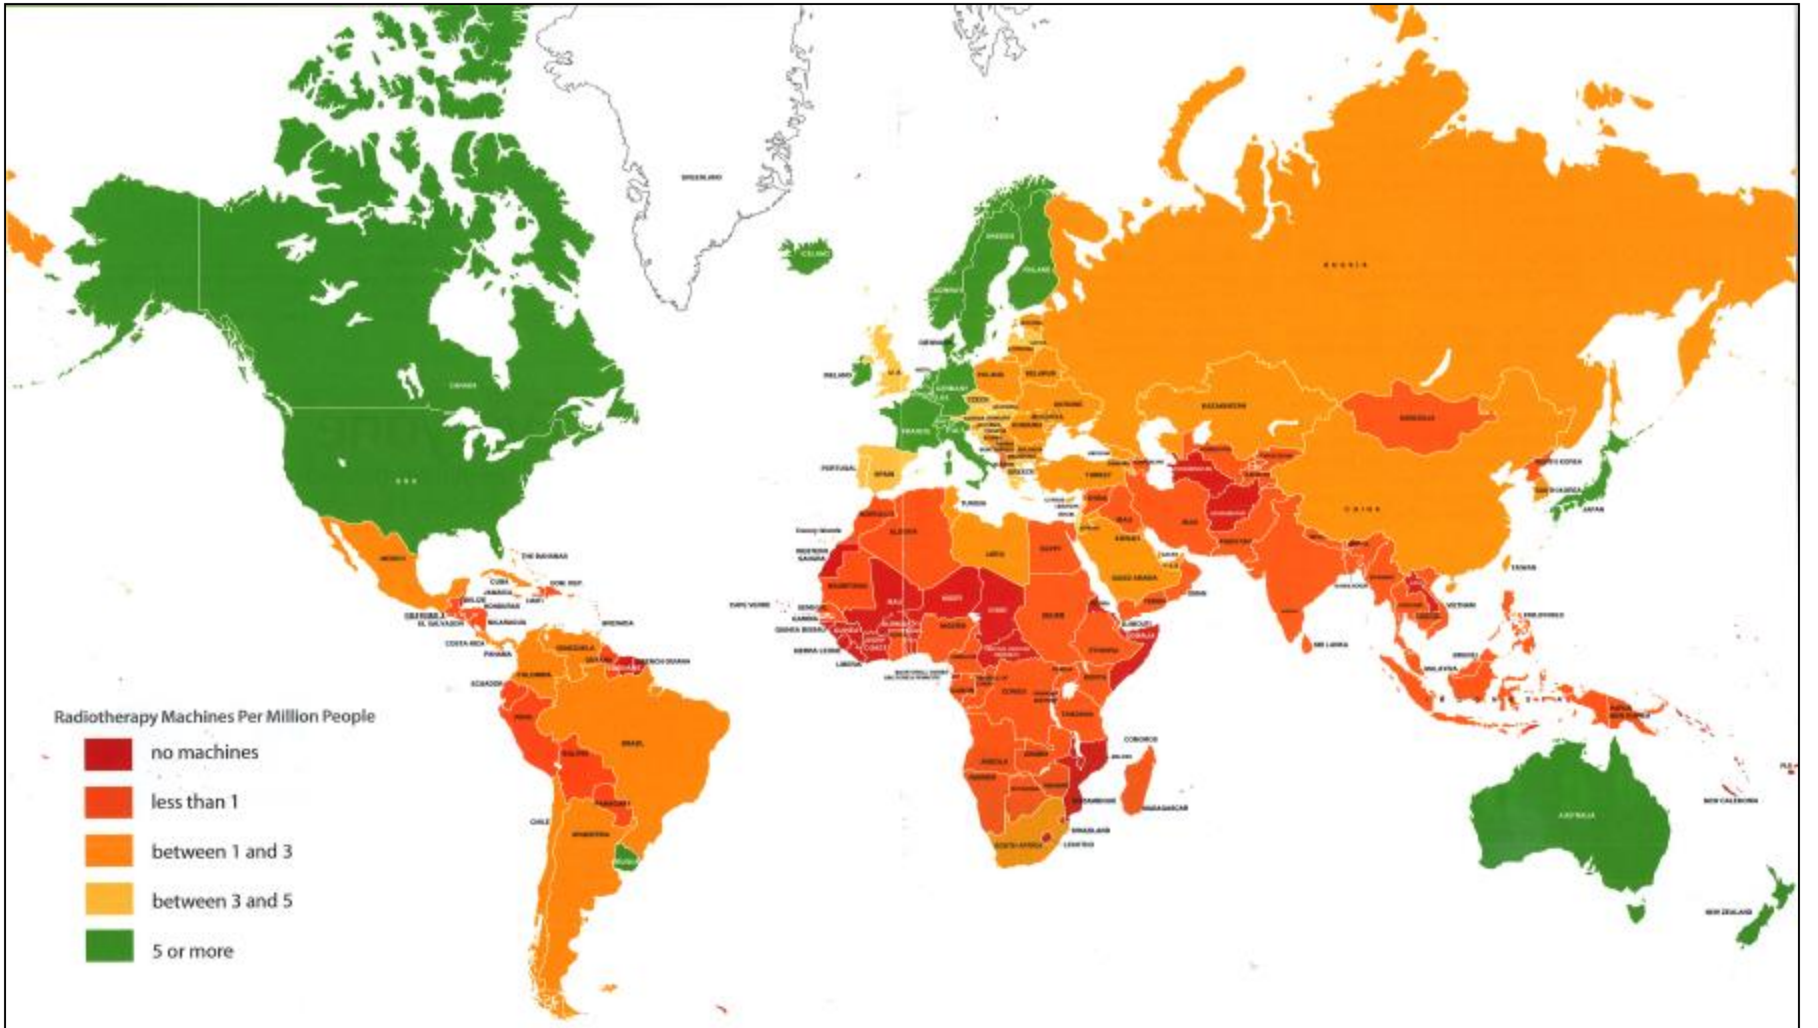
- Cyberknife
- IntraOperative RT (IORT)
- Intensity Modulated RT

Low-energy cyclotrons for production of radionuclides for medical diagnostics



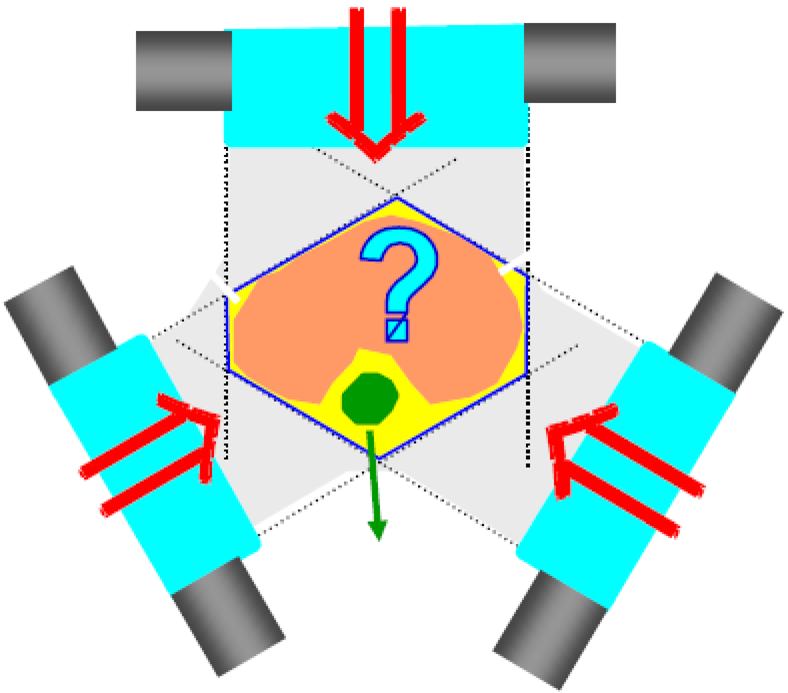
Medium-energy cyclotrons and synchrotrons for hadron therapy with protons (250 MeV) or light ion beams (400 MeV/u ^{12}C-ions)

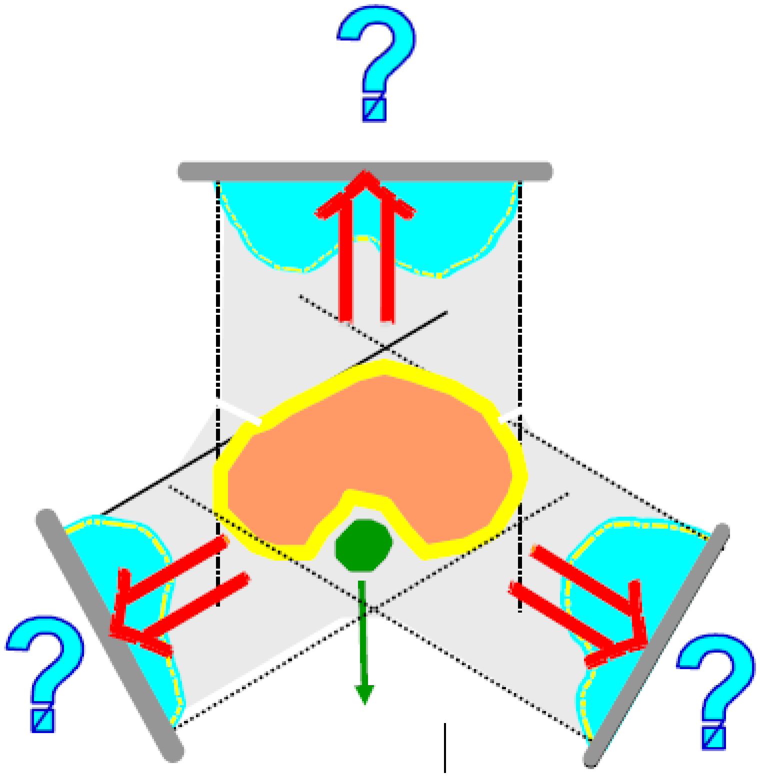
Availability of radiation therapy worldwide



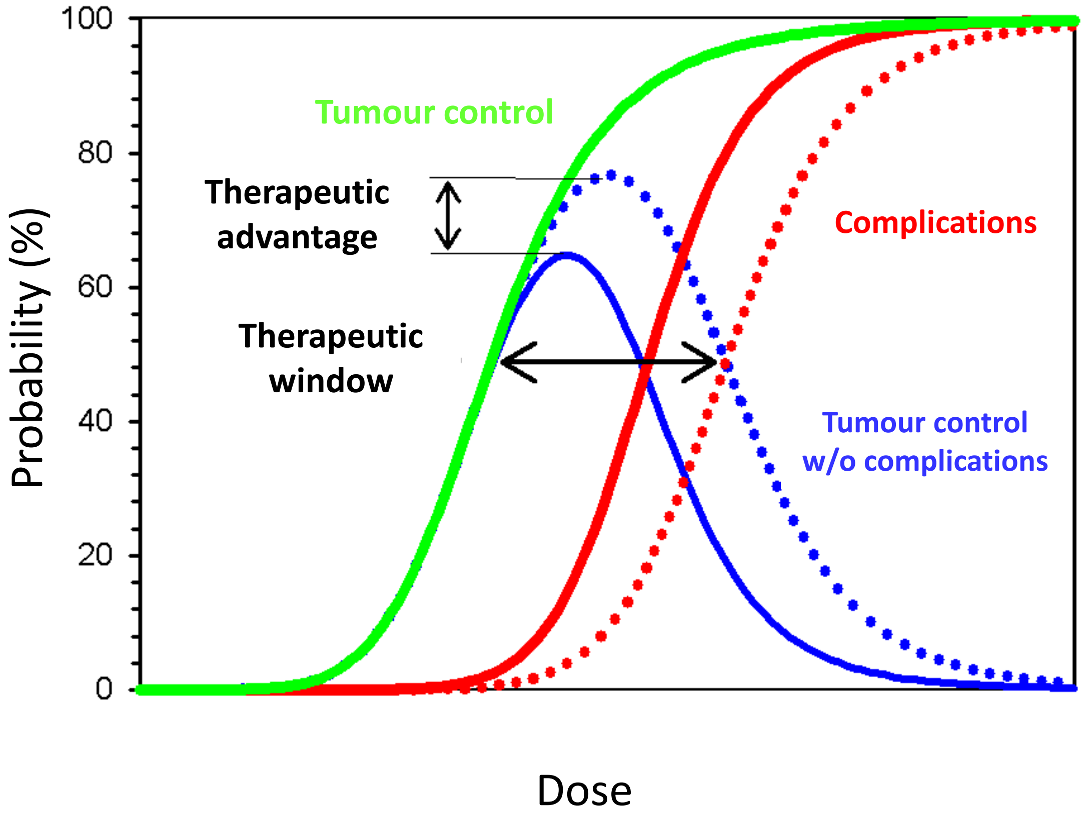
Number of radiation therapy machines per million people

Treatment planning and dose delivery to tumour volume

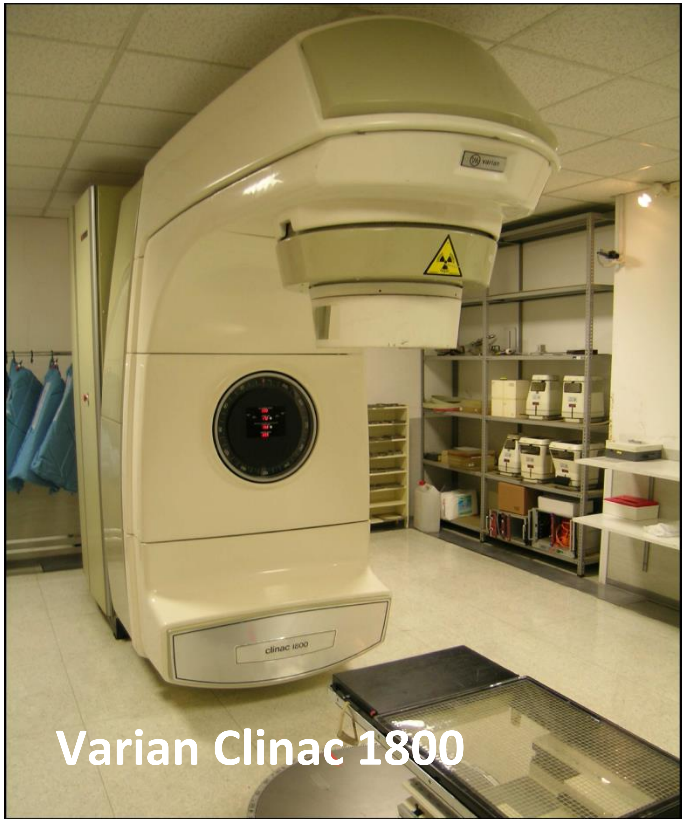


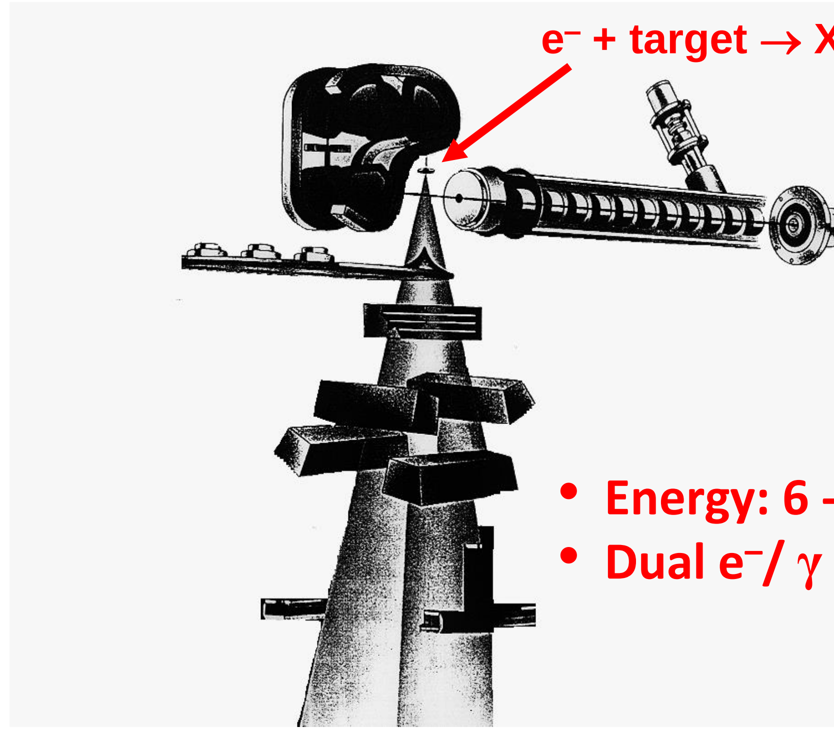


Tumour control and therapeutic window

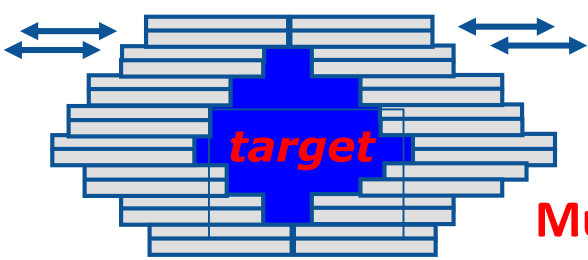


X-rays in radiation therapy: medical electron linacs

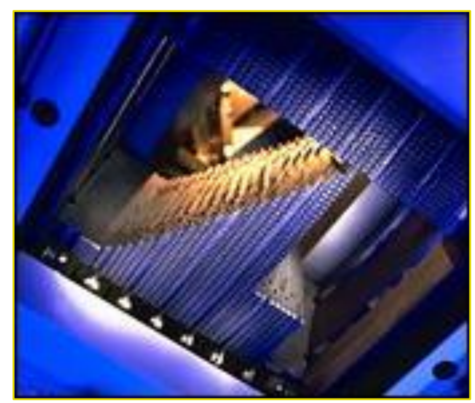




- **Energy: 6 -25 MeV**
- **Dual e^-/γ beams**



Multi-leaf collimator



Intra-Operative Radiation Therapy (IORT)

- Small electron linac
- Energy 6 – 12 MeV
- Treatment with electrons only
- Single irradiation
- Three models of linac produced by three manufacturers (two in Italy)

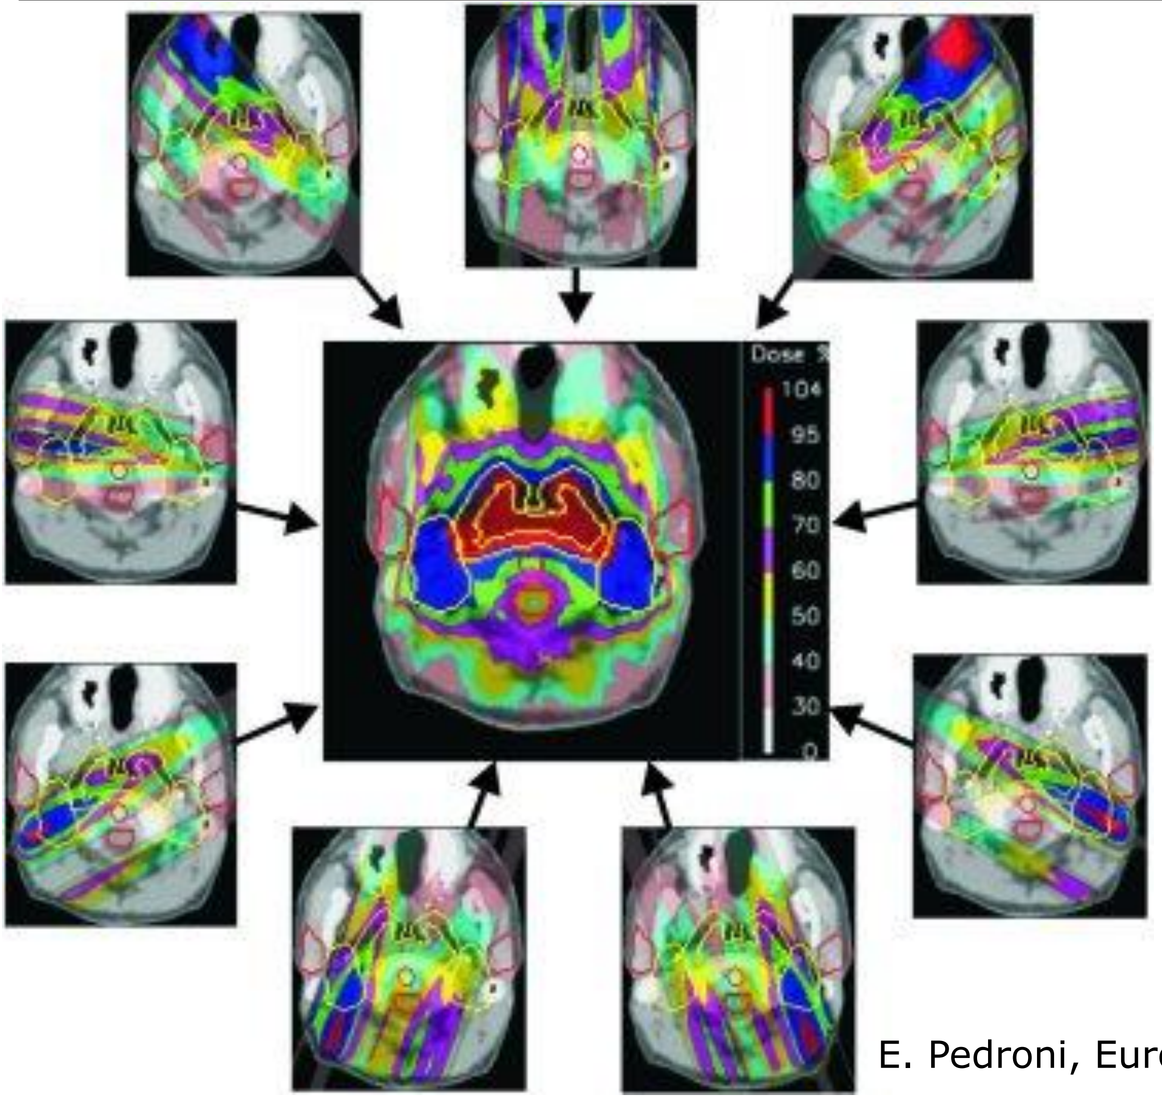
CyberKnife (CK) Robotic Surgery System

6 MV Linac mounted on a robotic arm

- Non-Isocentric
- Average dose delivered per session is 12.5 Gy
- 6 sessions/day
- Dose rate @ 80 cm = 400 cGy/min

http://www.accuray.com/Products/Cyberknife/index.aspx

Intensity Modulated Radiation Therapy

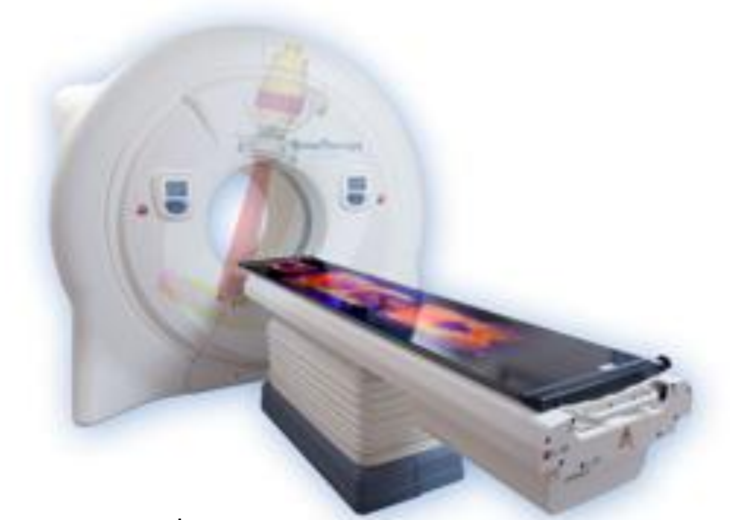


An example of intensity modulated treatment planning with photons. Through the addition of 9 fields it is possible to construct a highly conformal dose distribution with good dose sparing in the region of the brain stem (courtesy of T. Lomax, PSI).

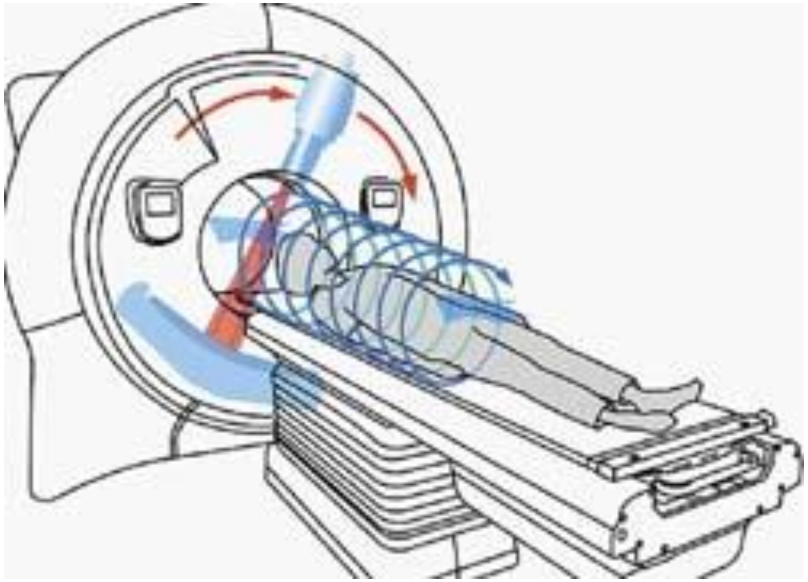
E. Pedroni, Europhysics News (2000) Vol. 31 No. 6

Yet X-rays have a comparatively poor energy deposition as compared to protons and carbon ions

Helical tomotherapy

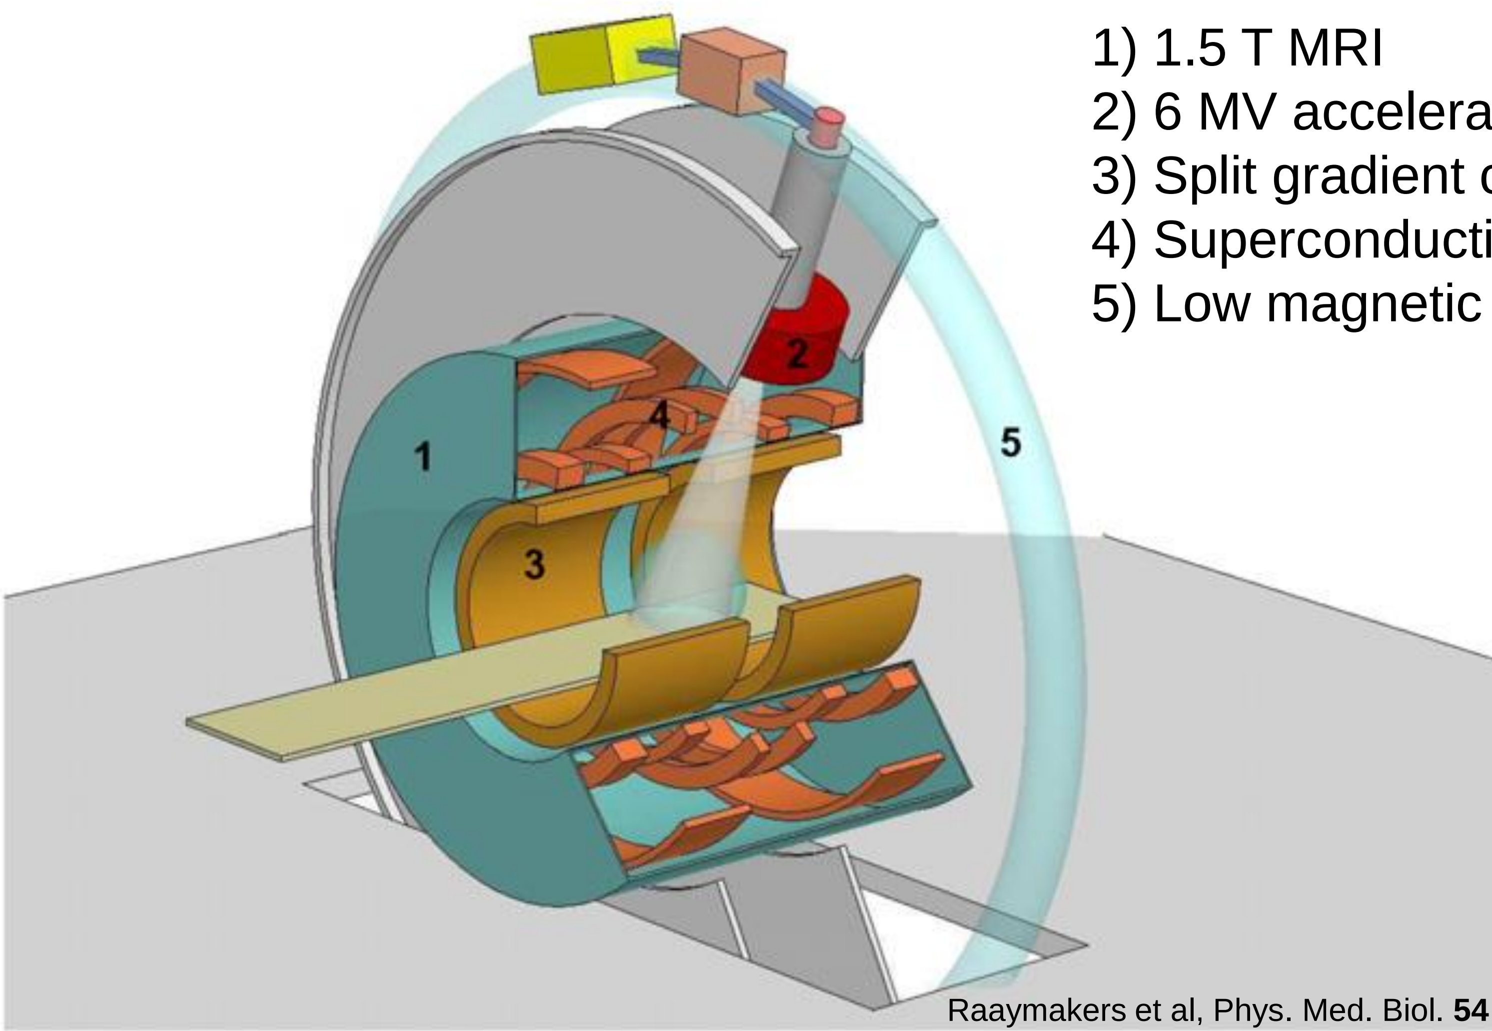


www.tomotherapy.com



- Integrated CT guidance
  - Integrated CT scanner allowing efficient 3D CT imaging for ensuring the accuracy of treatment
- A binary multi-leaf collimator (MLC) for beam shaping and modulation
- A ring gantry design enabling TomoHelical delivery
  - As the ring gantry rotates in simultaneous motion to the couch, **helical fan-beam IMRT** is continuously delivered from all angles around the patient
- Very large volumes can be treated in a single set-up

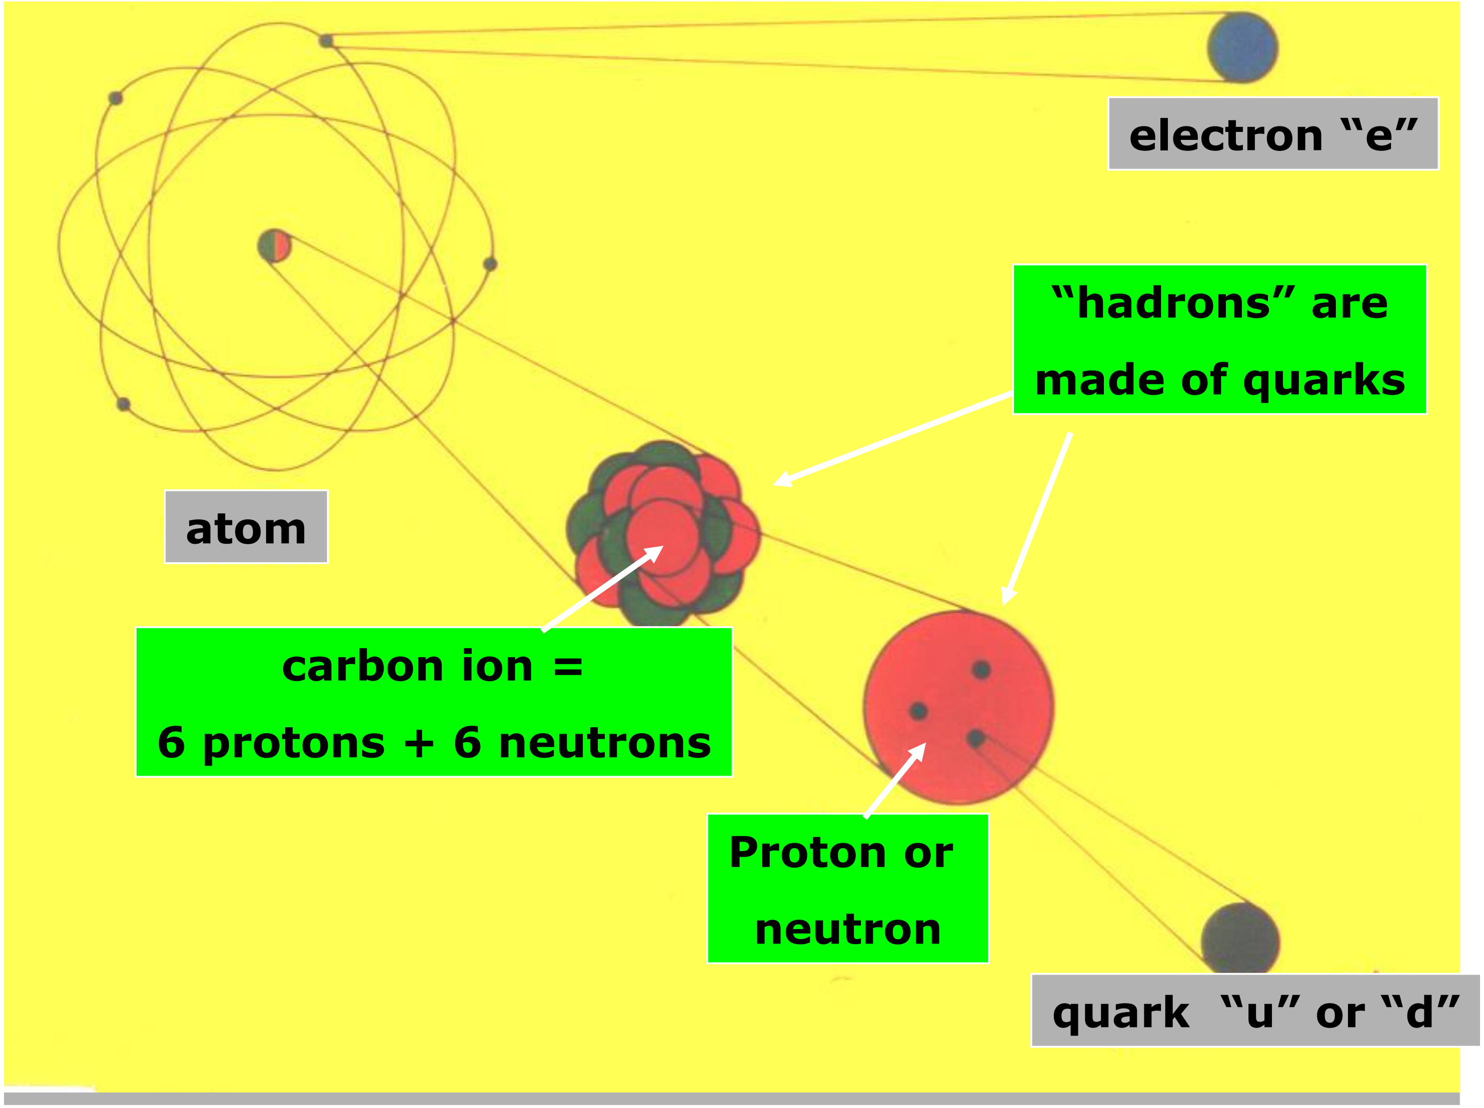
Dedicated sequences for MRI guided radiotherapy treatments



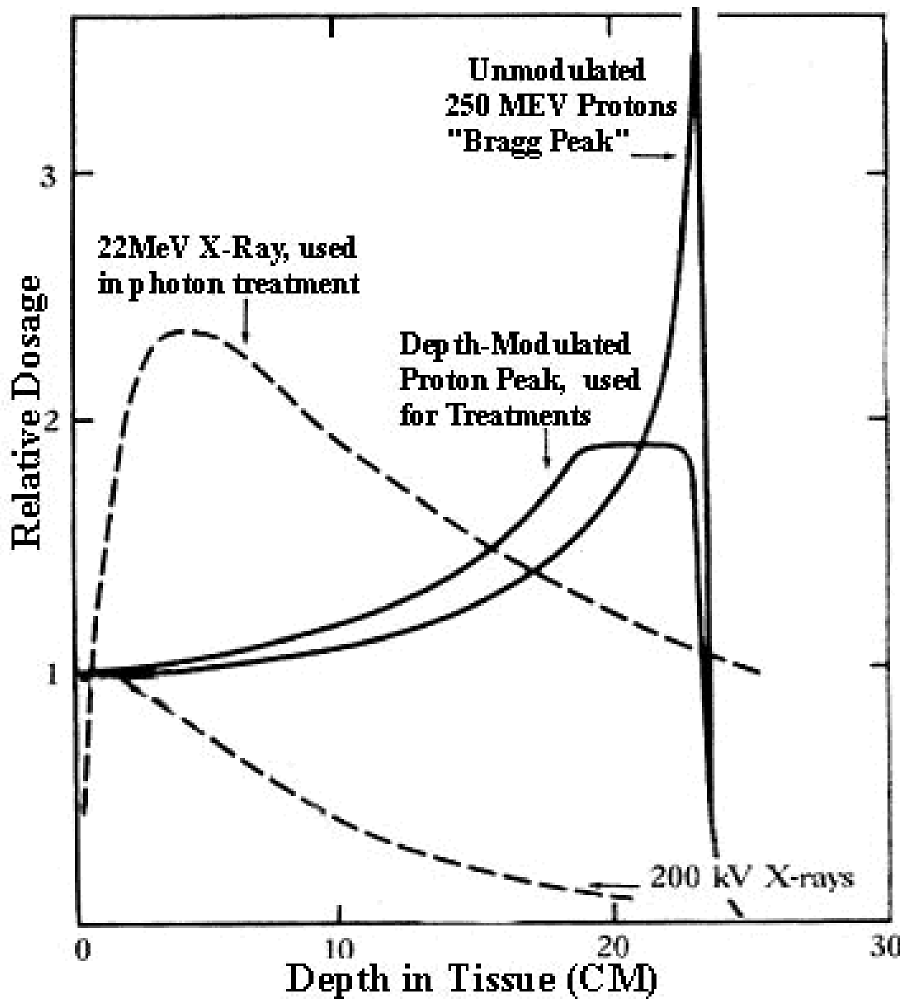
1) 1.5 T MRI
2) 6 MV accelerator
3) Split gradient coil
4) Superconducting coils
5) Low magnetic field toroid

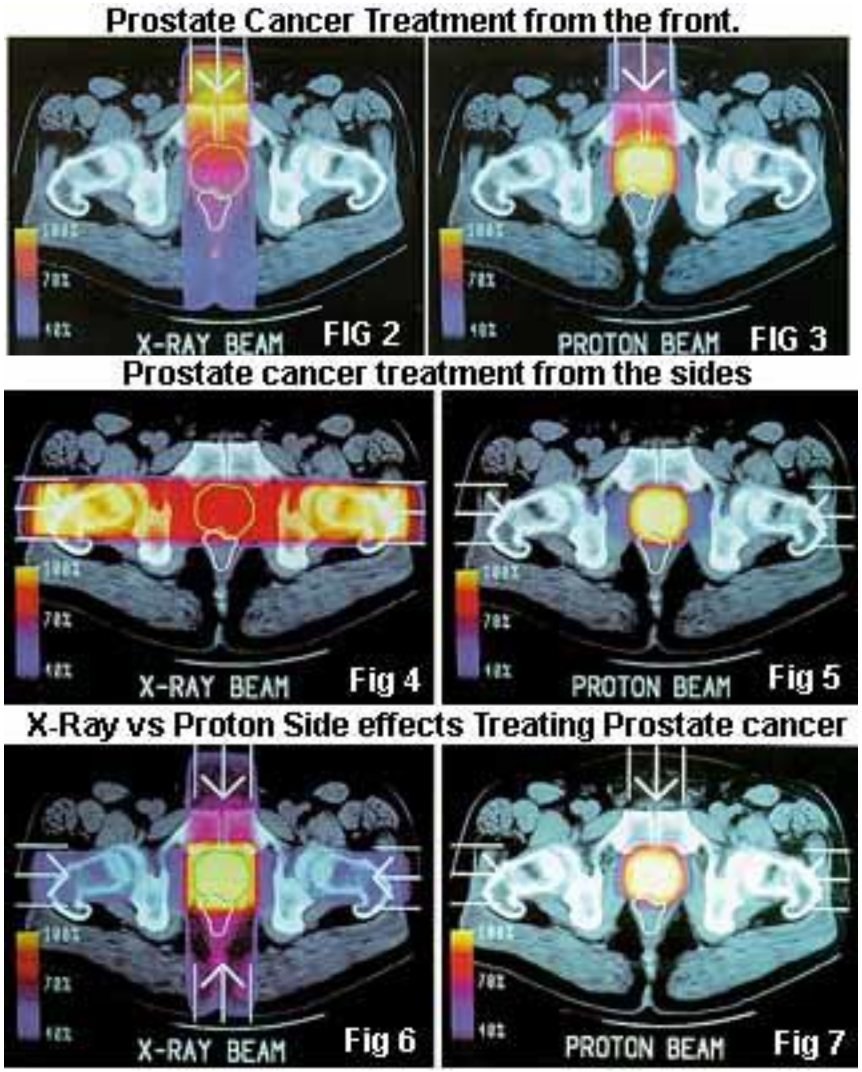
Raaymakers et al, Phys. Med. Biol. **54** (2009) N229–N237

Hadrontherapy: n, p and C-ion beams



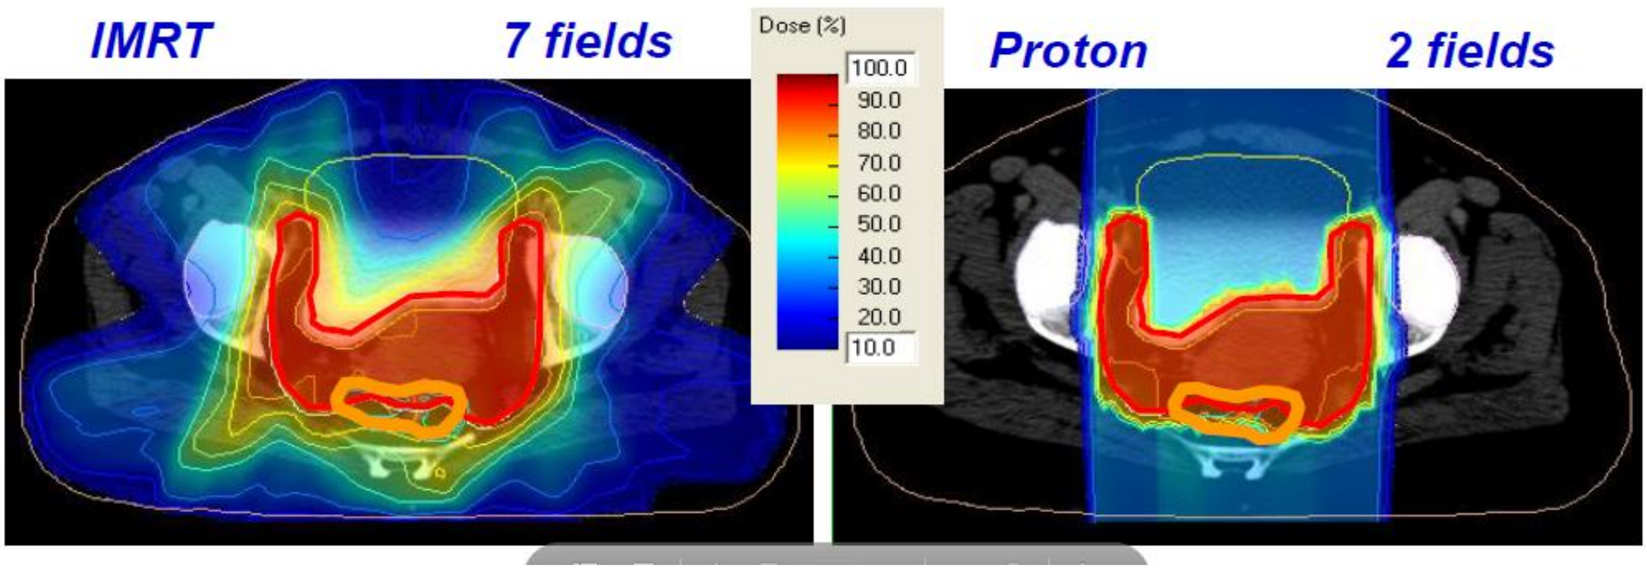
Proton radiation therapy



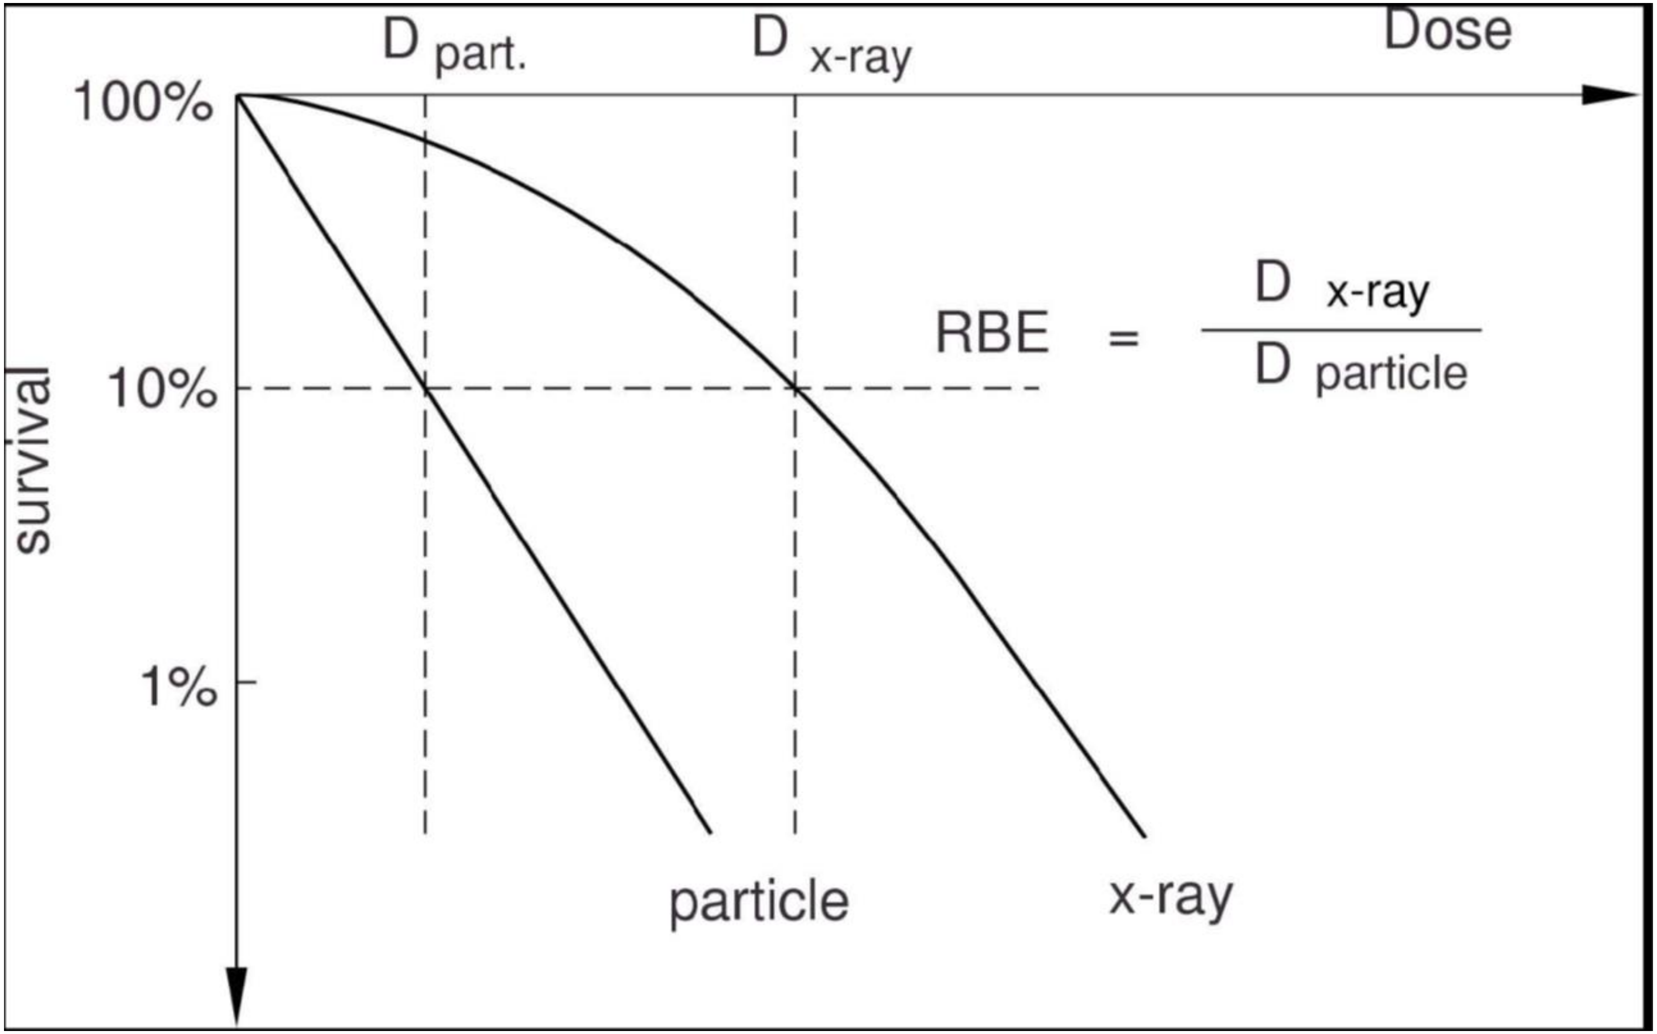


Treatment planning

- *Ion beam therapy is more conformal than photon beam RT*
- *Sharper dose fall off*
- *Range of ions much more influenced by tissue heterogeneities than photon beams with direct impact on TCP and NTCP*
- *Image guidance is necessary for ion beam therapy*



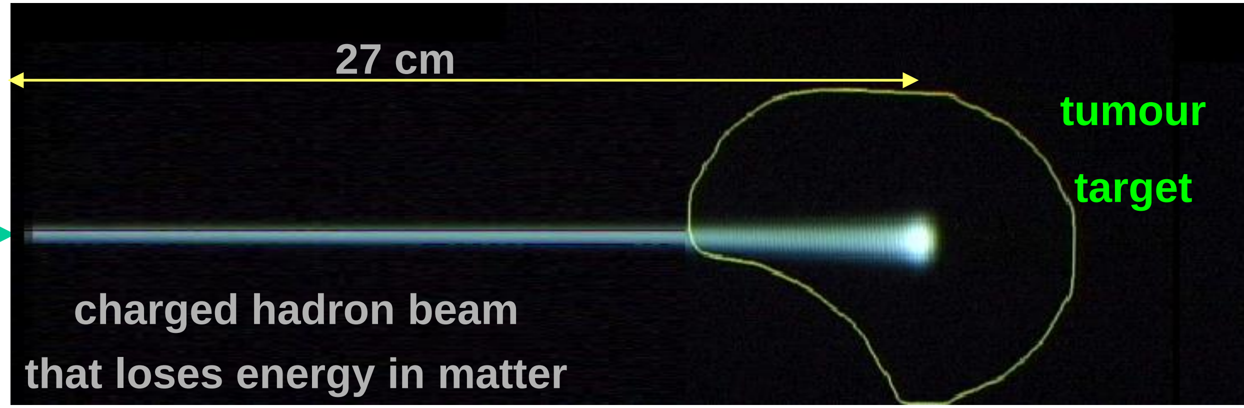
Radiobiological effectiveness (RBE)



Hadrontherapy

200 MeV protons

4800 MeV carbon ions



As of August 2015: 55 particle therapy facilities operation worldwide (mostly protons), 36 under construction, 14 at the planning stage

Number of patient treated until end of 2013

2054	He ions
1100	pions
13119	Carbon ions
433	other ions
105743	protons
122449	**Grand Total**

Proton radiation therapy
