The Sixth Annual Large Hadron Collider Physics Conference - LHCP 2018
June 8, 2018, Bologna (Italy)
Single Top Quark Physics

Single top quarks are produced through EW interactions. Three main modes:

- **t channel**
  - $q' \rightarrow t^\prime q~W$ (left)
  - $b \rightarrow t \bar{b}~W$ (center)
  - $g \rightarrow t \bar{b}~W$ (right)

- **s channel**
  - $q \rightarrow t \bar{b}~W$ (bottom)

- **tW channel**
  - $b \rightarrow t b^\prime W$ (middle)

Crucial insight into the electroweak processes of the SM

- Sensitive to
  - the $V_{tb}$ matrix element. Study of the $V_{tb}$ coupling
  - PDFs
  - new physics model (large couplings to exotic particles)

Background for precision tt physics and many BSM searches

t channel Production

- Represents ~73% of the total single top production at the LHC
- Distinct signature: light quark recoiling against the top quark
- Differential measurements are possible
- Can be used for a direct measurement of the Cabibbo–Kobayashi–Maskawa (CKM) matrix element $V_{tb}$
**t channel @ 13 TeV (2.2 fb⁻¹)**

- **Signature:** 1 μ, 2 jets, 1 b tag, MET
- **Signal extraction:** binned likelihood fit on the MVA output based on 11 kinematic variables
- **Simultaneous fit to the signal region (2j1b) and the two tt bkg regions (3j1b, 3j2b)**
  - **t channel signal strength and**
    - \( R_{t-ch} = \frac{\sigma_{\text{top}}}{\sigma_{\text{antitop}}} \)
  - **free parameters**
- **Main systematic**
  - **Signal modeling**

\[
\sigma_{t-ch, t+\bar{t}} = 238 \pm 13 \text{ (stat)} \pm 12 \text{ (exp)} \pm 26 \text{ (theo)} \pm 5 \text{ (lumi)} \text{ pb}
\]

\[
\sigma_{t-ch, t+\bar{t}}^{\text{th}} = 217.0^{+6.6}_{-4.6} \text{ (scale)} \pm 6.2 \text{ (PDF+\(a_s\)) pb (NLO)}
\]

\[ |f_{LV} V_{tb}| = 1.05 \pm 0.07 \text{ (exp)} \pm 0.02 \text{ (theo)} \]
tW Production

- Represents ~25% of the total single top production at the LHC
- Its production interferes with tt production at NLO (same final state)
  - Two configurations to subtract overlapping diagrams: diagram subtraction and diagram removal
**tW channel @ 13 TeV (35.9 fb⁻¹)**

- **Signature**: 2 OS leptons (eμ), 1 jet and 1 b tag

- **Three regions defined for signal extraction**
  - 1j1b (main signal region), 2j1b, 2j2b

- **Huge tt contribution in all the regions**

- **Signal strength determined from a ML fit to BDT distribution in the 1j1b and 2j1b regions and subleading jet $p_T$ in 2j2b**

- **Main uncertainties**
  - JES, lepton identification, tt modeling

---

$$\sigma_{tW} = 63.1 \pm 1.8 \text{ (stat)} \pm 6.4 \text{ (syst)} \pm 2.1 \text{ (lumi)} \text{ pb}$$

$$\sigma_{tW}^{(NNLO)} = 71.7 \pm 1.8 \text{ (scale)} \pm 3.4 \text{ (PDF)} \text{ pb}$$
**s channel Production**

- Extremely challenging final state
  - Rare process: ~3% of the total single top production at the LHC
  - Grows much slower with CME than other top production modes (@13 TeV, S/B does not improve...)
- Sensitive to new physics (W', charged Higgs)
**s channel @ 7 and 8 TeV (5.1 and 19.7 fb⁻¹)**

- **Signature:** 1 lepton, 2 jets, 2 b tags
- **Binned likelihood fit on the BDT output in 3 different regions:** 2j2b (signal), 3j2b (tt), 2j1b (t channel and W+jets)
- **Observed significance (combination):** 2.5σ
- **Main sys:** JES, generator, b-tagging

\[ \sigma_{s-ch} (7 \text{ TeV}) = 7.1 \pm 8.1 \text{ (stat+syst) pb} \]
\[ \sigma_{s-ch} (8 \text{ TeV}) = 13.4 \pm 7.3 \text{ (stat+syst) pb} \]

\[ \sigma_s (7 \text{ TeV}) = 4.56 \pm 0.07 \text{ (scale)} \pm 0.17 \text{ (PDF) pb} \]
\[ \sigma_s (8 \text{ TeV}) = 5.55 \pm 0.08 \text{ (scale)} \pm 0.21 \text{ (PDF) pb} \]
**tZ Production**

- Extremely rare process: 2 orders of magnitude smaller than tW
- Sensitive to top-Z and triple gauge boson WWZ couplings
  - Possible deviations may indicate physics BSM (FCNC, anomalous couplings)
- Typically studied decay mode: 3 isolated high-$p_T$ leptons, 1 b tagged jet
  - Small BR but much cleaner than 1 and 2 leptons channels
- Main backgrounds from ttV, WZ and non-prompt lepton production
3 leptons and Z candidate (2 OS leptons within ±10 GeV around Z mass)

Three regions of interest: 1 b tag jet (SR), 2 b tag jets (ttZ) and 0 b tagged jets (non-prompt leptons)

BDT trained against WZ, ttV and ZZ using top and Z reconstruction

- ME weights added to increase performance

\[ \sigma(t\ell^+\ell^-q) = 123^{+33}_{-31} \text{ (stat)}^{+29}_{-23} \text{ (syst)} \text{ fb} \]

\( \sigma_{t\ell(l)q} \text{ (NLO)} = 94.2 \pm 3.1 \text{ fb} \)

Observed (expected) significance: 3.7 (3.1)\( \sigma \)

Main systematics
- Bkg. normalization
- Signal modeling
**tγ Production**

- Extremely rare process
- Sensitive to the top quark charge and the top quark electric and magnetic dipole moments
**ty @ 13 TeV (35.9 fb\(^{-1}\))**

- **t-channel:** 1 \(\mu\), 1 \(\gamma\), MET, \(\geq 2\) jets, 1 b tagged jet
- **BDT** based on topological and kinematic properties:
  - Light jet \(\eta\), \(\cos (\mu, \text{light jet})\), muon \(\eta\), \(\Delta R(\text{light jet}, \gamma)\), top mass, jet multiplicity, \(W\) transverse mass, \(\mu\) charge
- Binned likelihood fit is performed to the BDT in the SR and the \(tt+\gamma\) CR (2 b tagged jets)
- Observed (expected) significance of 4.4 (3.0)\(\sigma\)
  - First evidence of this process!

\[
\mathcal{B}(t \to \mu \nu b) \sigma(t\gamma) = 115 \pm 17 \text{(stat)}^{+33}_{-27} \text{(syst)} \text{ fb}
\]

\[
\sigma_{ty} \text{(NLO)} = 81 \pm 4 \text{(scale+PDF)} \text{ fb}
\]

**Main systematics**
- JES and signal modeling

---

**Enrique Palencia (Oviedo)**

**Single Top at CMS – LHCP18**

**June 8, 2018**
In SM, FCNC are forbidden at tree level and highly suppressed at higher order

- $\text{BR}(t \rightarrow u/c \ Z) \approx 10^{-14}$

- Several SM extensions enhance these BRs and can be proved
Search focused on single top and tt FCNC interactions observable in 3l final states. The FCNC interaction might happen at the production or at the top quark decay.

Same selection as tZq analysis.

Two BDTs: one for single top and another one for tt FCNC.

4 lepton channels and 5 regions used.

Main systematics:
- modeling, JES, b-tagging.

Summary

CMS single top covers a broad range of analysis

- From precision measurements
  - $t$ and $tW$ channels
- To evidences of new processes
  - $s$ channel, $tZq$ and $tgamma$
- And searches for BSM processes
  - FCNC
- 2017 dataset is in the pipeline
- New results are coming soon
