Muon Identification and Isolation efficiencies on Run II data with the CMS experiment

Tuesday, 5 June 2018 16:00 (1h 30m)

The performance of muon identification and isolation efficiencies in CMS has been studied on data collected in pp collisions at 13 TeV at the LHC on the full 2017 dataset. The efficiencies have been computed with the tag-and-probe method, in different periods of data taking. Results obtained using data are compared with Monte-Carlo predictions.
