ALBA Accelerator

ALBA is a 3rd generation Synchrotron Light Source located in Barcelona

ALBA Accelerators

- ✓ **3 Accelerators**
 - Linac
 - Booster
 - Storage Ring (SR)
- ✓ **Beam stored at 3GeV**
- ✓ **Top-up mode up to 200mA**
 - Injection every 20min
- ✓ **8 BLs running**
- ✓ **4 BLs in construction**
- ✓ **6000 h of operation/year**

Pulsed elements at ALBA

Processes that required pulsed elements at ALBA

Injection from Linac to Booster

Extraction from Booster

Injection to Storage Ring

Booster pulsed elements

Injection to Booster & Extraction from Booster:

✓ On-axis processes

Injection to Booster

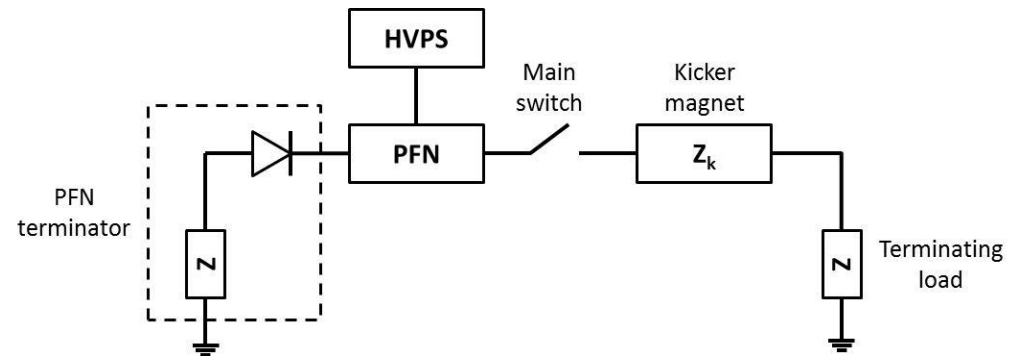

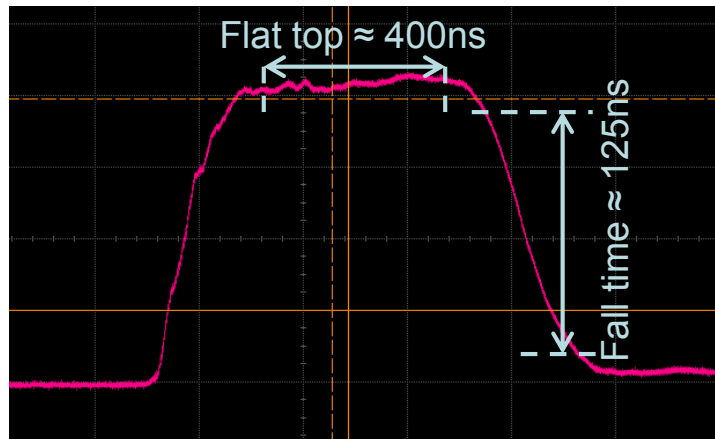

Extraction from Booster

✓ Fast switching kickers are needed to keep the beam after one turn

✓ Pulse forming circuit: PFN, Thyatron CX2610 from E2V and kicker magnet ($Z_k < 20\Omega$)

✓ Ripple (flat top): $\pm 5\%$

SR Injection Process

Injection to Storage Ring:

- ✓ Because of the stored beam on-axis injection cannot be used
- ✓ A set of 4 kickers create a local bump and the injected beam oscillates around this new orbit.

SR Injection Process

Injection to Storage Ring:

- ✓ Resonant discharge LC circuit: Uses GCT switches, a capacitor bank, and kicker magnet ($Z_k < 2\Omega$).
- ✓ Injection bump has to be as closed as possible to avoid residual orbit distortions that can affect the stored beam

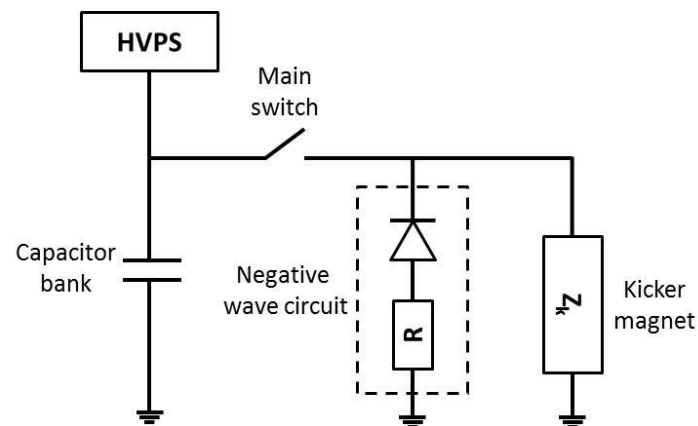

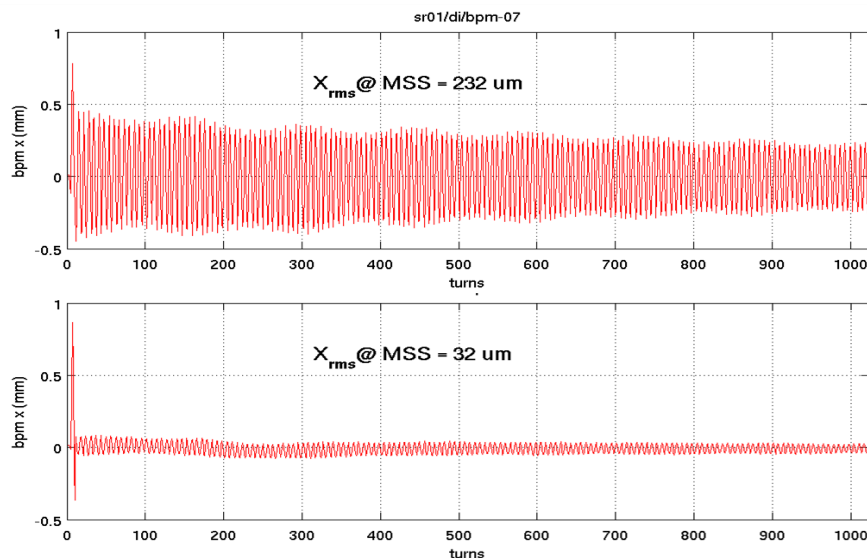

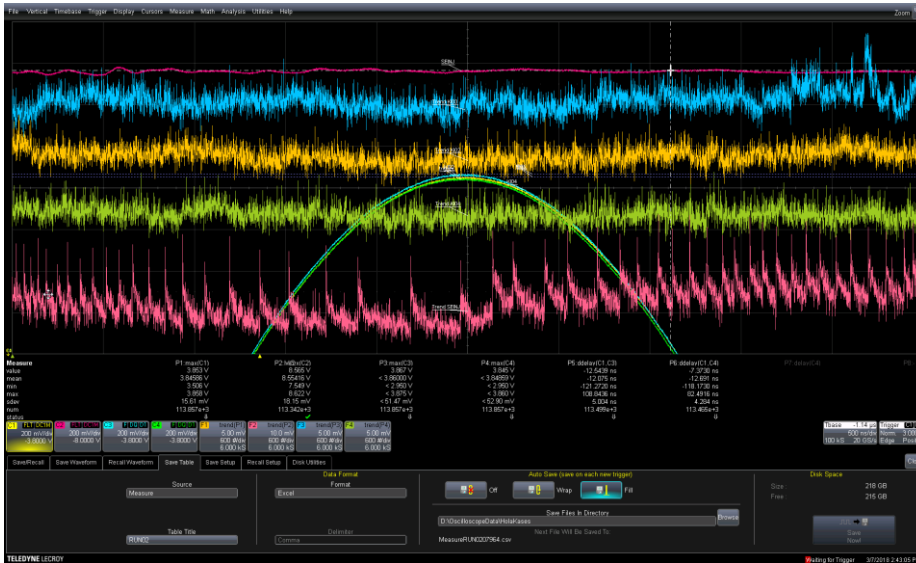

Table of contents

1. Introduction
2. Diagnostic hardware & software
3. First measurements
4. Summary

- ✓ LeCroy 425Zi scope with 20GS/s and 8 bits resolution
- ✓ Configured to measure the peak amplitudes and pulses delay
- ✓ Data saved as attributes in TANGO control system
- ✓ **BUT** depends on operator to start recording

Diagnostic hardware

	Scopes	AD Converters
Speed	✓	✓
Resolution	✓	✓
Price	🤔	🤔
Flexibility	✗	✓
User friendly	✗	✓

Diagnostic hardware

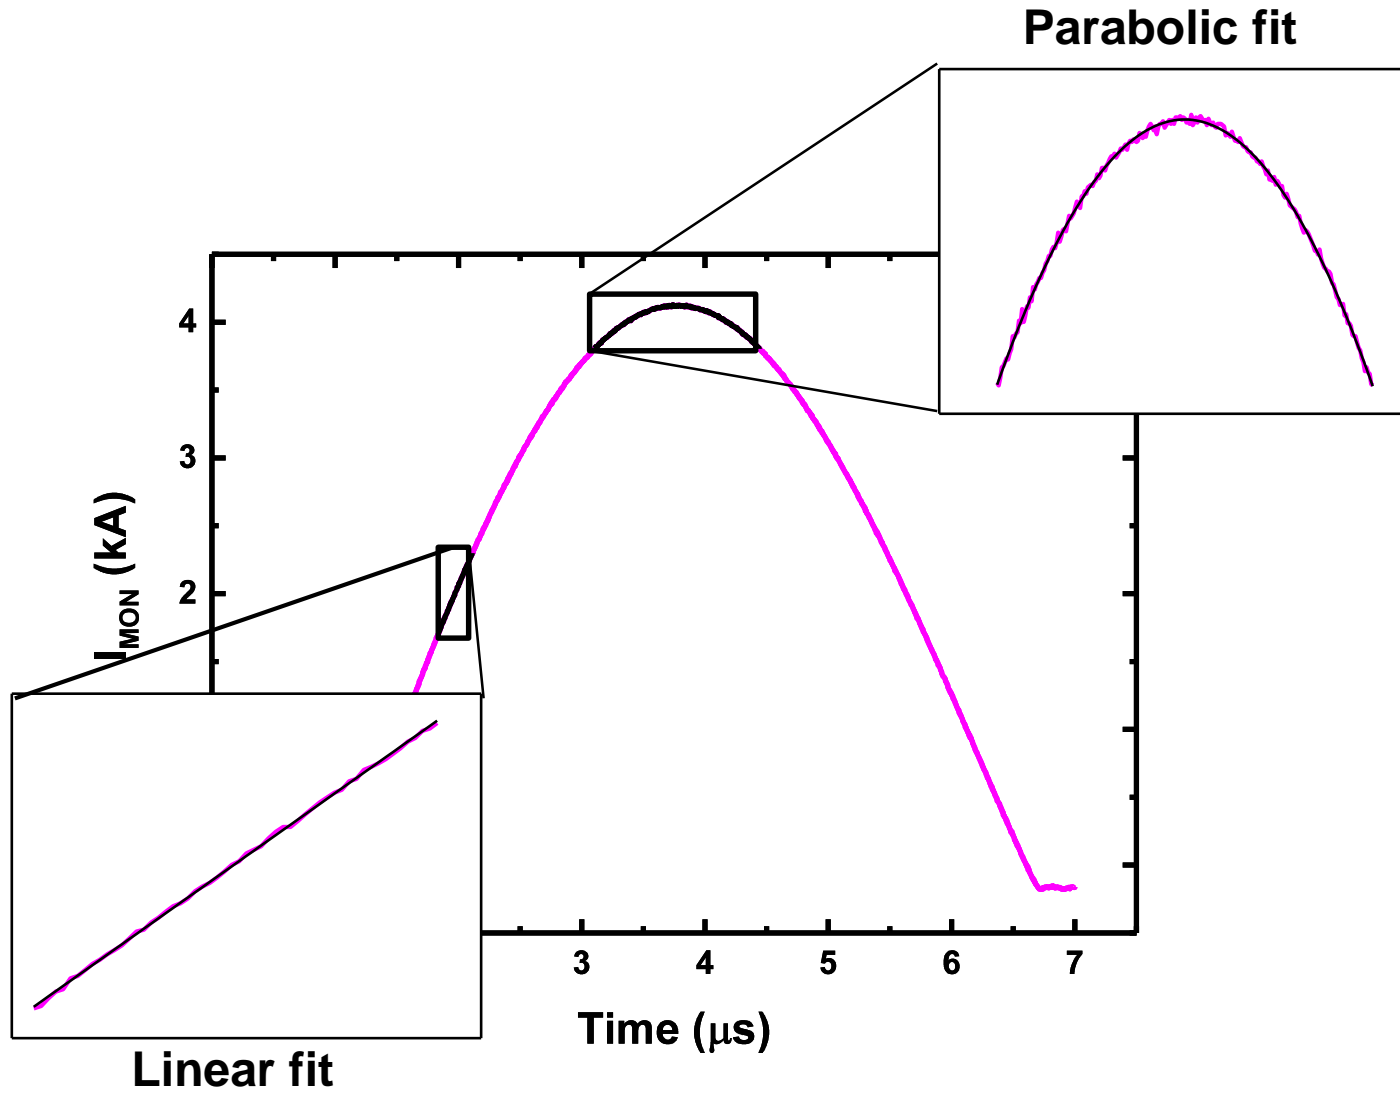

ADLINK PCIe-9852 Digitizer

- ✓ 14-bit resolution
- ✓ Sampling rate 200MS/s
- ✓ Up to 90MHz Bandwidth
- ✓ 50 Ω or 1M Ω impedance
- ✓ Offset error ± 1 mV
- ✓ 2 channels per card

Resolution

Resolution

- ✓ Comparable resolution to the LeCroy scope
- ✓ Vertical resolution: 0.03%
- ✓ Time resolution: 1ns

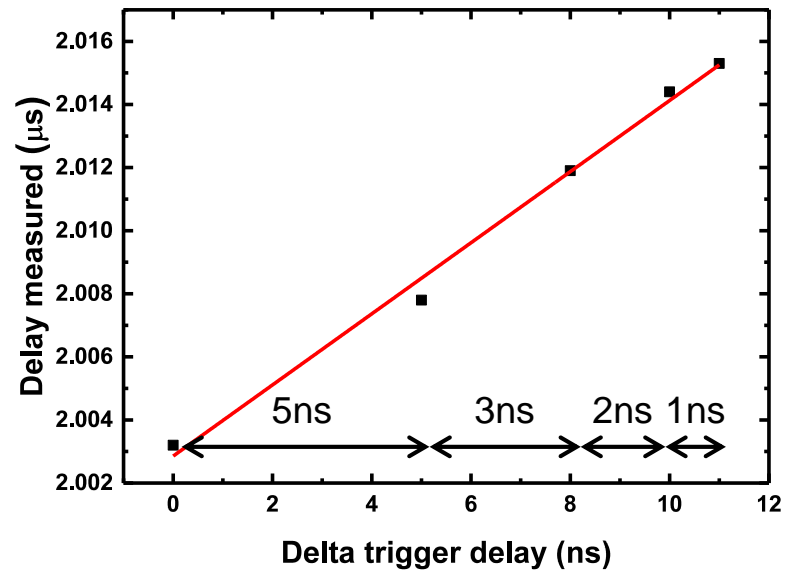

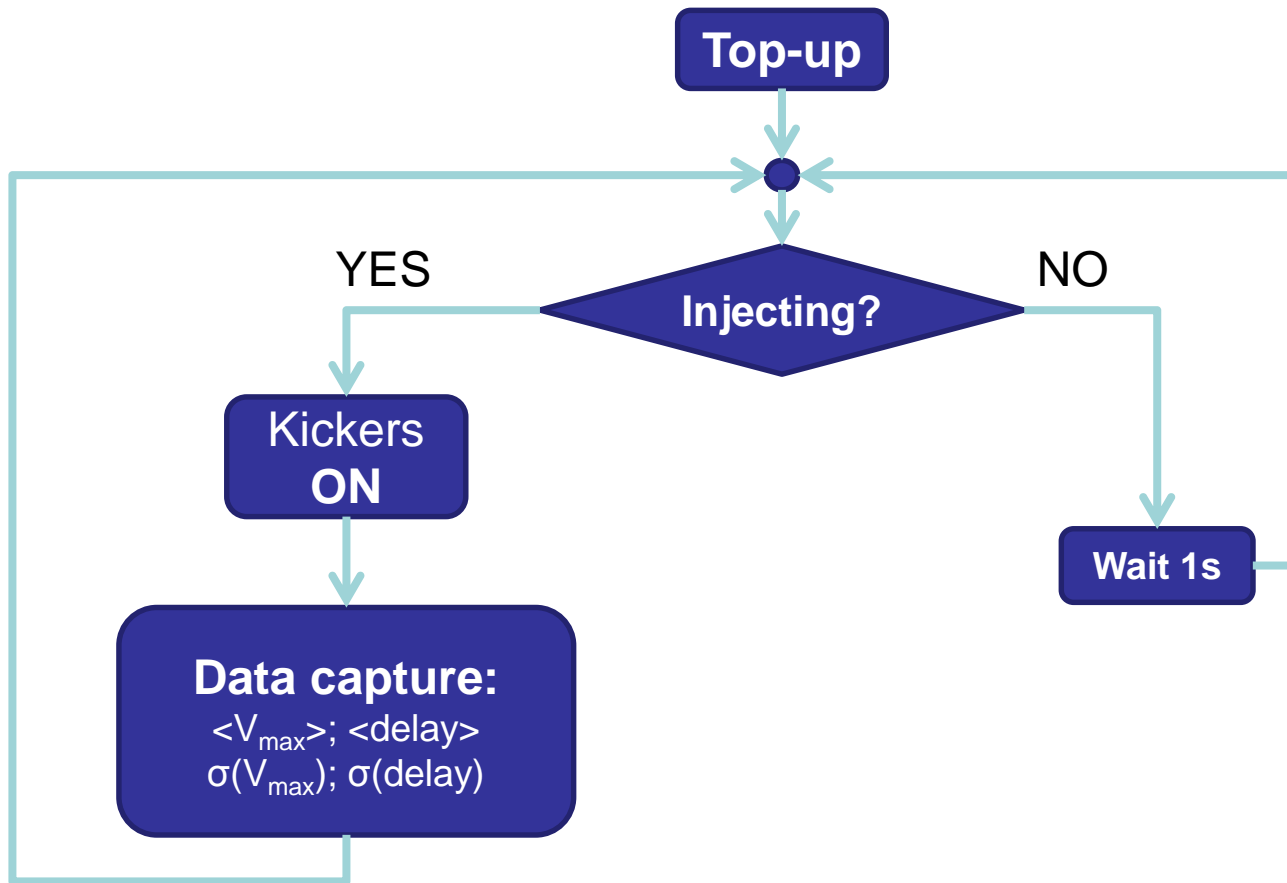

Table of contents

1. Introduction
2. Diagnostic hardware & software
- 3. First measurements**
4. Summary

Measurements during operation

- ✓ 30 pulses per MBM_injection and per magnet
- ✓ Data averaging per injection and per magnet of pulse peak and delay

Measurements

Measurements

Changes in KI03's amplitude caused a bump increment

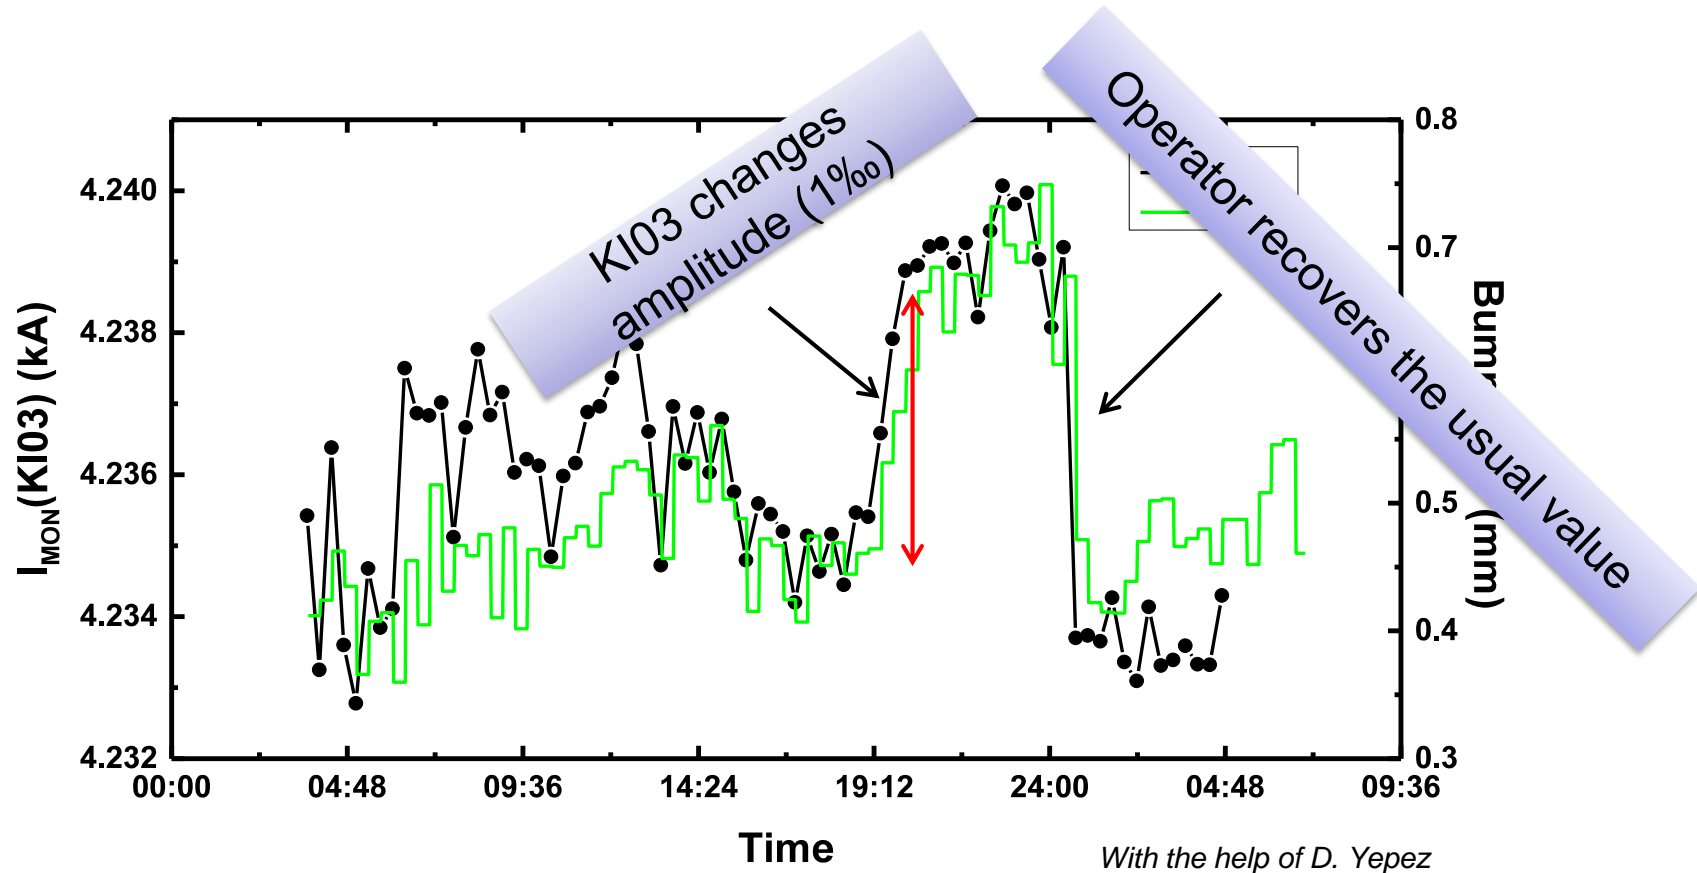

Table of contents

1. Introduction
2. Diagnostic hardware & software
3. First measurements
4. Summary

Summary

- ✓ A new diagnostic system is proposed to measure the SR Kickers in the ALBA synchrotron.
- ✓ The system is based on ADCs: **ADLINK PCIe-9852 Digitizer**.
- ✓ The resolution is 0.03% in amplitude and 1ns in time.
- ✓ The ADCs will allow continuous monitoring of the kickers and correlation with the injection bump.
- ✓ Integration into TANGO control system under development.
- ✓ Next step: allow automatic correction of kickers amplitudes & delays

Thanks!
