Taking care of the BRAIN

TECHNOLOGIES

BRAIN

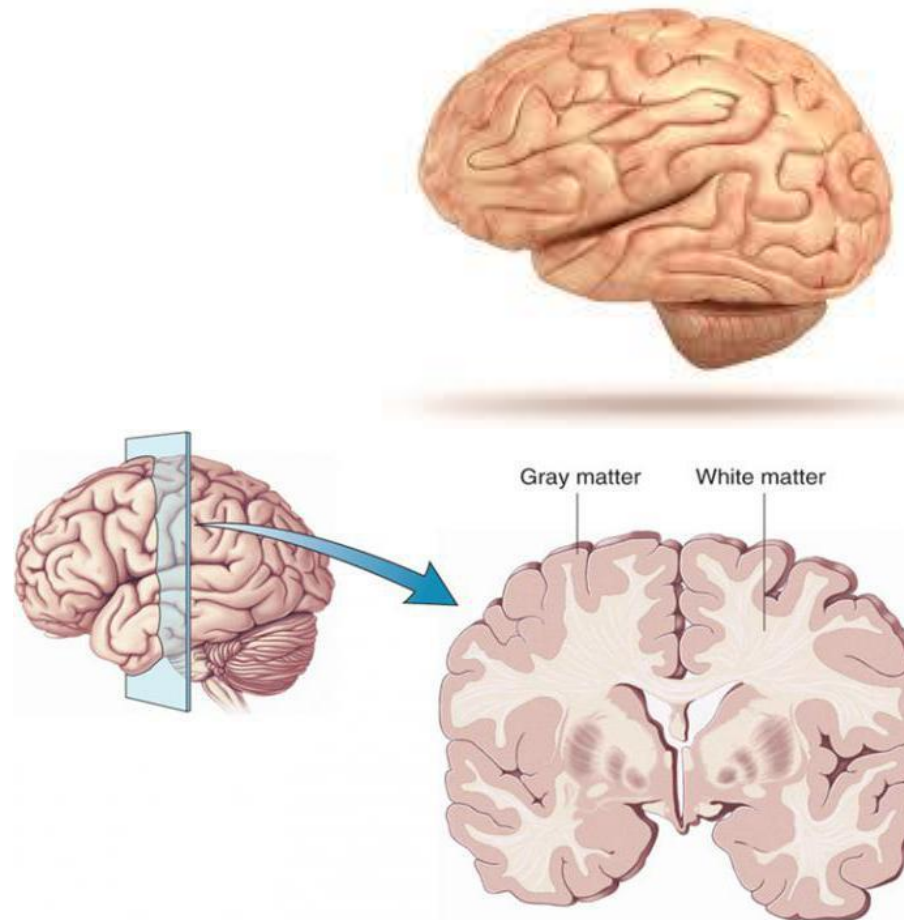

The BRAIN: the most complex human system...

...with still a lot of unexplored properties

To make the **BRAIN** understandable...a funny analogy

BRAIN: Structure and Function

Frontal

- Personality
- Emotions and arousal
- Intelligence
- Ability to concentrate, make decisions, plan, put things in order, solve problems
- Awareness of what is around you
- Voluntary movement
- Ability to speak and write
- Behaviour control

Parietal

- Sensations: pain, touch, temperature
- Understanding and interpreting sensory information, such as size, colour and shape
- Understanding space and distance
- Math calculations

Occipital

- Vision
- Interpreting what you see

Temporal

- Ability to understand language
- Hearing
- Memory, long-term storage of memories
- Organization and planning
- Behaviour and emotions

Brain stem

- Breathing
- Heart rate control
- Consciousness, alertness, wakefulness
- Swallowing
- Blood pressure
- Sweating

Cerebellum

- Balance
- Motor (movement) coordination
- Posture
- Fine motor skills

LOGIC vs EMOTION

Corpus callosum: more than just a midline structure

SPLIT-Brain Syndrome

The **SCIENCE** behind the human **BRAIN** is **COMPLEX**

Anatomy

Complex Networking

Computational power

Human BRAIN

The human **BRAIN** has 100 billion **Neurons**, each of which is connected to **10 thousand** other neurons.

Sitting on your shoulders the BRAIN is the most complicated object in the known **universe**.

Symptoms

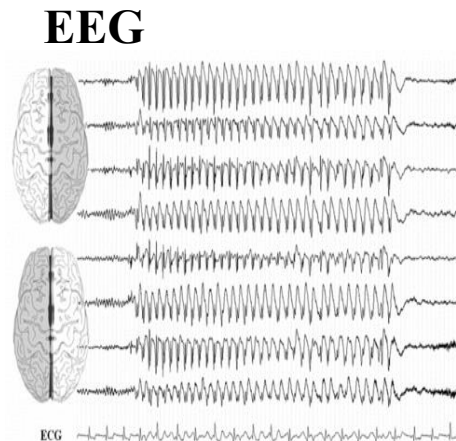

NOT sufficient to make diagnosis

Brain Imaging Technologies to look at STRUCTURE ...

In structural imaging, machines take snapshots of the brain's large-scale anatomy and allow researchers to look inside the brain.

...and FUNCTION

Functional imaging provides a dynamic view of the brain, showing which areas are active during thinking and perception.

The fMRI and EEG are very important tools mostly used in diagnosis of different neurological condition that affect the normal functioning of the brain also without any apparent structural alteration.

FIGURE 1. Display of region weights of scaled SSM topography associated with HD overlaid on standardized Talairach MRI sections (13,20). Regional metabolic covariance pattern was identified in PET data from combined group comprised of 6 neurologically normal, presymptomatic HD gene carriers with normal striatal D₂ receptor binding and 8 age-matched, gene-negative control subjects. Topography was characterized by relative decreases in striatal and mediotemporal metabolism covarying with metabolic increases in occipital region. We designated this topography as HDRP.

ABSTRACT

Recent advances in machine learning yielded new results in highly successful applications in many pattern recognition tasks. In this paper we provide a hearing aid system, relying on a manually designed convolutional neural network (CNN), aiming for a system that can ultimately be trained on a large data set of around 45,000 images.

DECODING THOUGHTS

BRAIN-COMPUTER INTERFACE (BCI)

BCI systems are designed to acquire electrical signals from the **BRAIN** and process them into commands for **effector devices** to perform the patient's desired action.

BCI and its success to provide patient-controlled compensation for the loss of muscle movement and communication

BCIs can now even allow humans with paraplegia (paralysis of all four limbs) to control a robotic arm through thought alone, or allow users to spell out words on a computer screen using just their mind.

At-home devices have huge implications to reduce costs for hospitals and insurance companies, and—if the technology is up to par—results in a more natural set of data for the patient.

The REVOLUTION in the diagnosis of RARE DISEASES

More than

300 million

people worldwide

are affected by **RARE DISEASE**

Rare Diseases

Facial hallmark and
dysmorphic feature

Facial signatures of some rare diseases
can be subtle and difficult to diagnose,
even for a trained professional

“

*Rare diseases often go **unrecognized** precisely because of their rarity, resulting in a delay in diagnosis.*

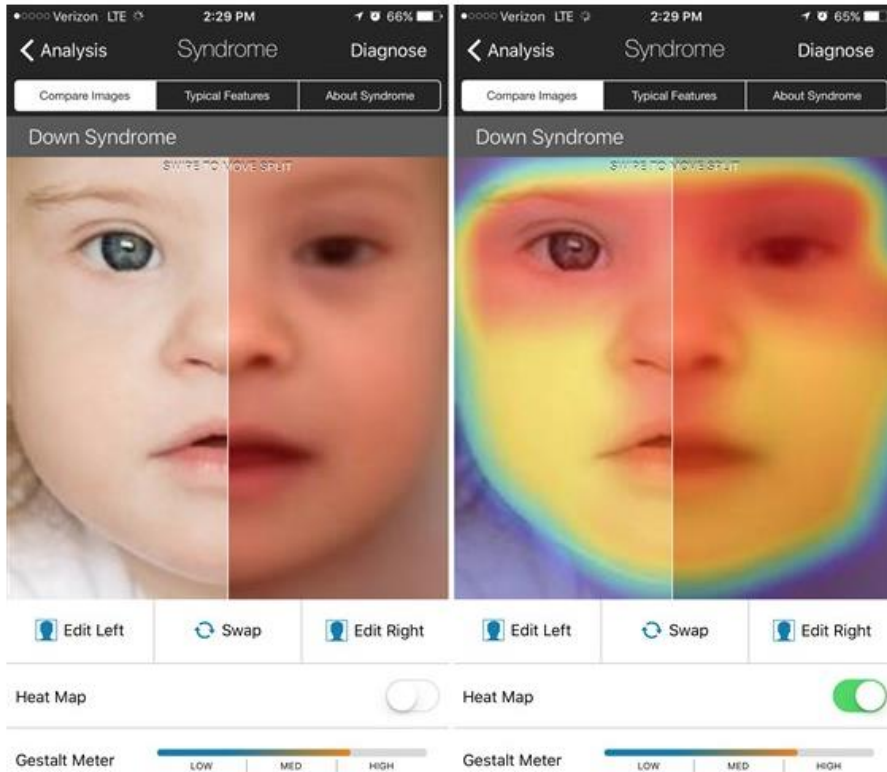

”

Most of patients with **rare diseases** often suffer a significant **delay** in **diagnosis**. Many diseases are so rare that a general physician is unlikely to see a single case in his career.

The symptoms of rare diseases are often atypical and can point in many different directions. As a result, the correct diagnosis is often delayed for several years.

Identifying facial phenotypes of genetic disorders using deep learning

Yaron Gurovich^{1*}, Yair Hanani¹, Omri Bar¹, Guy Nadav¹, Nicole Fleischer¹, Dekel Gelbman¹, Lina Basel-Salmon^{2,3}, Peter M. Krawitz⁴, Susanne B. Kamphausen⁵, Martin Zenker⁵, Lynne M. Bird^{6,7} and Karen W. Gripp⁸

— Facial recognition app Face2Gene is being used by doctors to diagnose rare diseases. Courtesy FDNA

Deep learning-based new technology that can help clinicians and geneticists to diagnose rare disease based on patient facial phenotypes

The technology converts a patient photo into de-identified mathematical facial descriptors (facial descriptors)

The latest medical technology that leverages the power of big data to make better diagnoses and more accurate predictions.

Face2Gene™
Facial Dysmorphology Novel Analysis
At Your Fingertips

A free genetic search and reference mobile app
powered by facial analysis technology

The smartphone screen displays the following information:
- Title: Cornelia de Lange syndr...
- Images: Two side-by-side photos of a child's face, one with a heatmap overlay.
- Features: Depressed Nasal Bridge ✓, Flat Philtrum ✓.
- Description: Classic Cornelia de Lange syndrome is characterized by distinct facial features, growth retardation (prenatal onset <5th centile throughout life), hirsutism, and upper limb reduction defects that range from subdysplasia to phalangeal...

Face2Gene's system uses a machine-learning algorithm. It learns from every new face it scans. The more data it acquires through its use, the more accurate should be the diagnoses.

Snapping a quick photo of the child's face within a matter of seconds, the app generated a list of potential diagnoses.

95% 
OF RARE DISEASES
HAVE NO APPROVED
DRUG TREATMENTS

**RARE DISEASES do not
have cure**

A Startup Using **Artificial Intelligence** To Find Cures For some Rare Diseases

Healx is a tech company from the Cambridge Cluster (UK), focussed on accelerating treatments for rare diseases. It integrates artificial intelligence with deep pharmacology to translate therapies into the clinic within 24 months. Thereby, dramatically reducing the time and cost compared to conventional drug discovery. To achieve this goal, Healx developed the most comprehensive AI-based drug discovery platform for rare diseases: Healnet. With the objective to translate 100 rare disease treatments towards the clinic by 2025.

“Our mission was to apply our technology and approach to identify and validate already approved drugs that may treat some of the most severe symptoms of the disease”
