

Mont Blanc

What is next in particle physics?

Archamps, Genève, CERN,
PS, SPS, LEP/LHC, FCC, CLIC etc... under the fog

Jura, mountain goats (chamois)

Alain Blondel

1994-1999: top mass predicted (LEP, mostly Z mass&width)
 top quark discovered (Tevatron)
 t'Hooft and Veltman get Nobel Prize

(c) Sfyrla

1997-2013 Higgs boson mass cornered (LEP H , M_Z etc +Tevatron m_t , M_W)
 Higgs Boson discovered (LHC)
 Englert and Higgs get Nobel Prize

IT LOOKS LIKE THE
 STANDARD MODEL
 IS COMPLETE.....

Is it the end?

Is it the end?

Certainly not!

- Dark matter
- Baryon Asymmetry in Universe
- Neutrino masses

are **experimental proofs** that there is more to understand.

We must continue our quest

HOW?

Direct observation of new particles (but not only!)

New phenomena (Neutral currents, CP violation, neutrino oscillations...)

Deviations from precise predictions

(ref. Uranus to Neptune, top and Higgs preds from LEP/SLC/Tevatron/B factories, g-2, violation of unitarity, lepton number violation etc...)

1998 Experimental birth of .. Beyond the Standard Model

Kamioka mine detectors

Prize share: 1/2

The Nobel Prize in Physics 2015 was awarded jointly to Takaaki Kajita and Arthur B. McDonald *"for the discovery of neutrino oscillations, which shows that neutrinos have mass"*

The discovery of neutrino oscillations shows that neutrinos have mass

Sudbury Neutrino Observatory

1000 ton of heavy water D₂O
12 m diam. 9456 PMTs

Determine that all neutrinos reach the earth but only 1/3 remain of same flavour as produced in the sun

Neutrinos having mass and mixing.....

1. → there shall be CP violation (just like in quarks)
2. → there should be right-handed neutrinos.

Alain B

Neutrinos: *detection of*

neutrino interactions

The anti-neutrino coming from the nuclear reactor interacts with a proton of the target, giving a positron and a neutron.

The positron annihilates with an electron of target and gives two simultaneous photons ($e^+ + e^- \rightarrow \gamma\gamma$).

The neutron slows down before being eventually captured by a cadmium nucleus, that gives the emission of 2 photons about 15 microseconds after those of the positron.

All those 4 photons are detected and the 15 microseconds identify the "neutrino" interaction.

Reines and Cowan

1953

The target is made of about 400 liters of water mixed with cadmium chloride

4-fold delayed coincidence

Neutrinos

the weak neutral current

**Gargamelle Bubble Chamber
CERN**

Discovery of weak neutral current

$$\nu_{\mu} + e \rightarrow \nu_{\mu} + e$$

$$\nu_{\mu} + N \rightarrow \nu_{\mu} + X \text{ (no muon)}$$

previous searches for neutral currents had been performed in particle decays
(e.g. $K^0 \rightarrow \mu\mu$) leading to extremely stringent limits (10^{-7} or so)

early neutrino experiments had set their trigger on final state (charged) lepton!

elastic scattering of neutrino
off electron in the liquid freon

1973 Gargamelle

experimental birth of the Standard model

Neutrinos

astrophysical neutrinos

Ray Davis

since ~1968

Homestake Detector

Solar Neutrino Detection 600 tons of chlorine.

- Detected neutrinos $E > 1\text{MeV}$
- fusion process in the sun

solar : $pp \rightarrow pn \ e^+ \ \nu_e$ (then D gives He etc...)

these ν_e do $\nu_e + {}^{37}\text{Cl} \rightarrow {}^{37}\text{Ar} + e^-$

they are **neutrinos**

- The rate of neutrinos detected is **three** times less than predicted!

solar neutrino 'puzzle' since 1968-1975!

solution: 1) solar nuclear model is wrong or 2) neutrino oscillate

Super-K detector

Water Cerenkov
detector

50000 tons of
pure light
water

≈10000 PMTs

Super-Kamiokande-I solar neutrino data

May 31, 1996 – July 13, 2001 (1496 days)

^8B flux : $2.35 \pm 0.02 \pm 0.08$ [$\times 10^6$ /cm²/sec]

$$\frac{\text{Data}}{\text{SSM(BP2004)}} = 0.406 \pm 0.004 \begin{matrix} +0.014 \\ -0.013 \end{matrix}$$

(Data/SSM(BP2000) = $0.465 \pm 0.005 \begin{matrix} +0.016 \\ -0.015 \end{matrix}$)

neutrino definitions

the **electron** neutrino is present in association with an **electron** (e.g. beta decay)

the **muon** neutrino is present in association with a **muon** (pion decay)

the **tau** neutrino is present in association with a **tau** ($W \rightarrow \tau \nu$ decay)

these **flavor-neutrinos** are not (as we know now) quantum states of well defined **mass** (neutrino mixing)

the **mass-neutrino** with the highest **electron** neutrino content is called ν_1

the **mass-neutrino** with the next-to-highest **electron** neutrino content is ν_2

the **mass-neutrino** with the smallest **electron** neutrino content is called ν_3

Lepton Sector Mixing

★ If neutrinos are
mass eigenstates

that the
 : the same:

Pontecorvo 1957

NB This is a ridiculous picture:
 the size is inversely proportional
 to the mass (energy)

Oscillation Probability

★ The case with two neutrinos:

→ A mixing angle: θ

→ A mass difference:

$$\Delta m^2 = m_2^2 - m_1^2$$

$$\begin{pmatrix} \nu_\alpha \\ \nu_\beta \end{pmatrix} = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \end{pmatrix}$$

★ The oscillation probability is:

Δm^2 en eV^2

L en km

E en GeV

$$P(\nu_\alpha \rightarrow \nu_\beta) = \sin^2 2\theta \sin^2 \left(1.27 \Delta m^2 \frac{L}{E} \right)$$

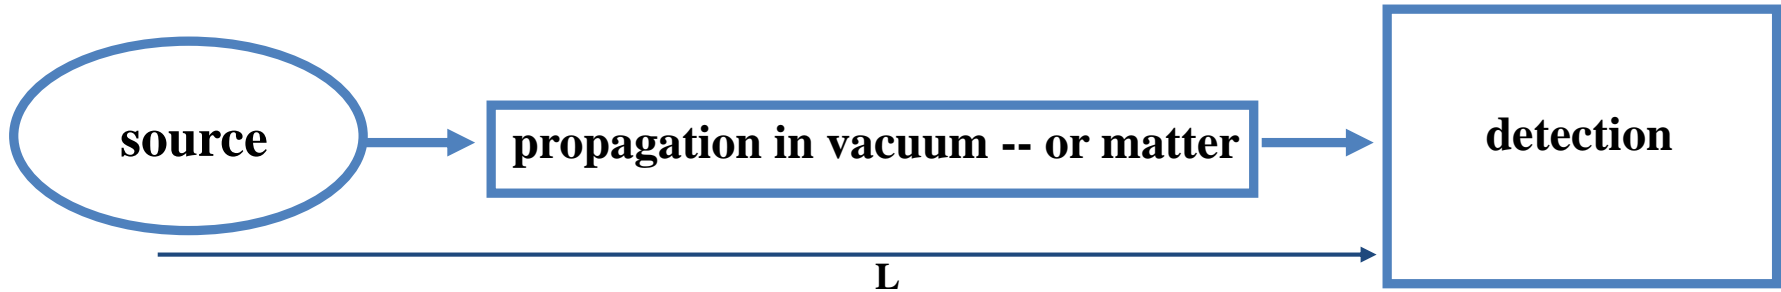

where L = distance between source and detector

E = neutrino energy

Hamiltonian = $E = \text{sqrt}(p^2 + m^2) = p + m^2 / 2p$

for a given momentum, eigenstate of propagation in free space are the mass eigenstates!

Neutrino Oscillations (Quantum Mechanics lesson 5)

weak interaction
produces
'flavour' neutrinos

e.g. pion decay $\pi \rightarrow \mu\nu$

$$|\nu_\mu\rangle = \alpha |\nu_1\rangle + \beta |\nu_2\rangle + \gamma |\nu_3\rangle$$

Energy (i.e. mass) eigenstates
propagate

$$|\nu(t)\rangle = \alpha |\nu_1\rangle \exp(i E_1 t) + \beta |\nu_2\rangle \exp(i E_2 t) + \gamma |\nu_3\rangle \exp(i E_3 t)$$

$$t = \text{proper time} \propto L/E$$

α is noted $U_{1\mu}$

β is noted $U_{2\mu}$

γ is noted $U_{3\mu}$ etc....

weak interaction: (CC)

$$\nu_\mu N \rightarrow \mu^- X$$

or $\nu_e N \rightarrow e^- X$

or $\nu_\tau N \rightarrow \tau^- X$

$$P(\nu_\mu \rightarrow \nu_e) = |\langle \nu_e | \nu(t) \rangle|^2$$

SNO detector

Aim: measuring non ν_e neutrinos in a pure solar ν_e beam

How? Three possible neutrino reaction in heavy water:

only ν_e

equally

$$\nu_e + \nu_\mu + \nu_\tau$$

in-unequally

$$\nu_e + 0.1 (\nu_\mu + \nu_\tau)$$

1000 ton of D_2O

Far vs. Near Comparison : Spectrum

$\sin^2 2\theta_{13} = 0.092$

Spectral distortion consistent with oscillation.

$$\sin^2 2\theta_{13} = 0.092 \pm 0.016 \text{ (stat)} \pm 0.005 \text{ (syst)}$$

$\sin^2 2\theta_{13} = 0$ excluded at 5.2σ

Daya Bay: the Latest Results

$$P_{ee} = 1 - \sin^2 2\theta_{13} \sin^2 \left(\frac{\Delta m_{ee}^2 L}{4E} \right) - \cos^4 \theta_{13} \sin^2 2\theta_{12} \sin^2 \left(\frac{\Delta m_{21}^2 L}{4E} \right)$$

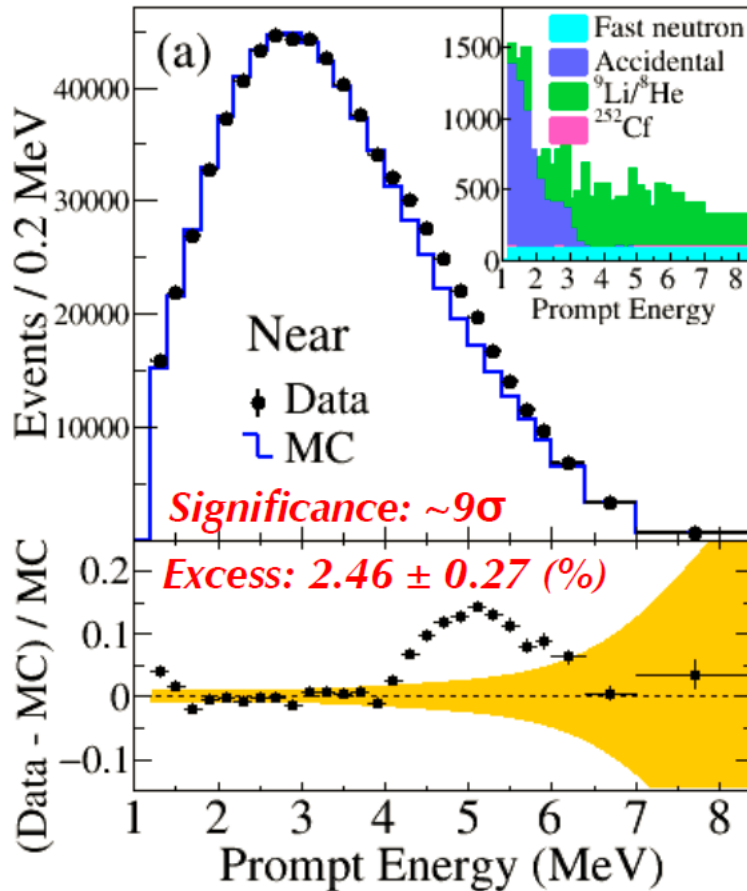

$$\sin^2 2\theta_{13} = 0.0841 \pm 0.0027(\text{stat.}) \pm 0.0019(\text{syst.})$$

$$|\Delta m_{ee}^2| = [2.50 \pm 0.06(\text{stat.}) \pm 0.06(\text{syst.})] \times 10^{-3} \text{ eV}^2$$

The Reactor Flux Spectrum Discrepancy

RENO preliminary

Daya Bay CPC

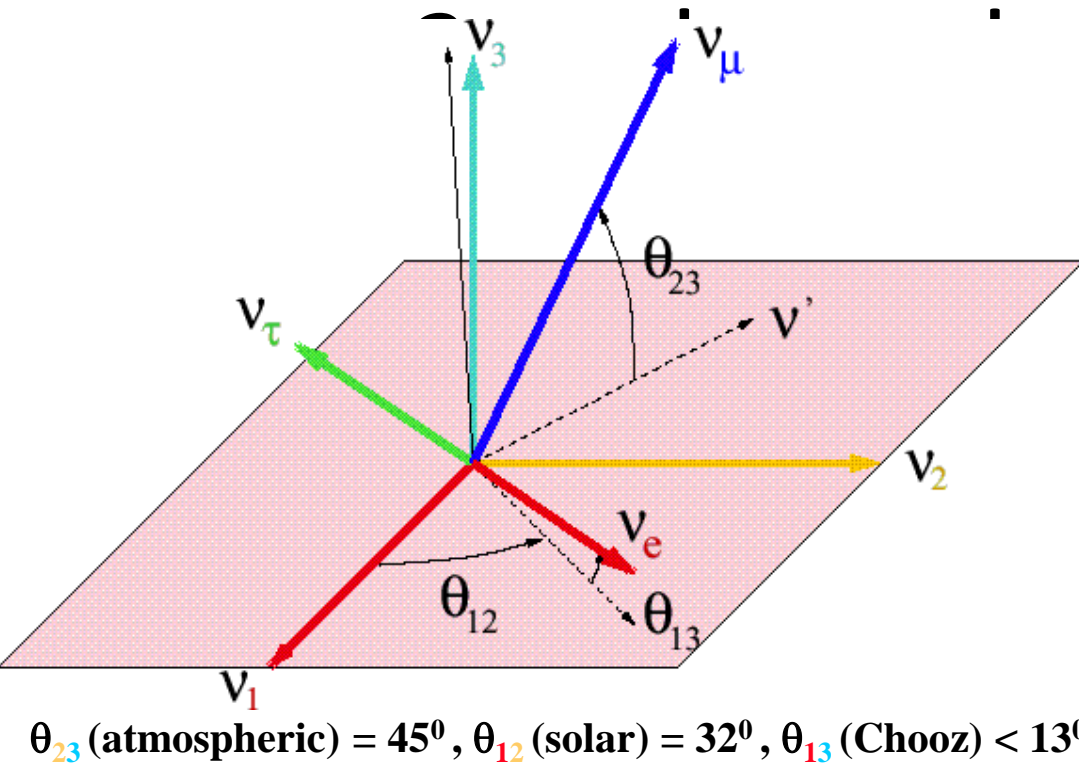

Blaming fission isotope beta decay calculation/data?

For example, see: Dwyer & Langford, PRL114 (2015)012502; Hayes et al, PRL112 (2014) 202501

reactor experiments allow investigation of reactor calculations! (and... badly off)

The neutrino mixing matrix:

phase δ

$$U_{\text{MNS}} : \begin{pmatrix} \sim \frac{\sqrt{2}}{2} & \sim -\frac{\sqrt{2}}{2} & \sin \theta_{13} e^{i\delta} \\ \sim \frac{1}{2} & \sim \frac{1}{2} & \sim -\frac{\sqrt{2}}{2} \\ \sim \frac{1}{2} & \sim \frac{1}{2} & \sim \frac{\sqrt{2}}{2} \end{pmatrix}$$

Unknown or poorly known today phase δ , sign of Δm_{13}^2

Oscillation maximum $1.27 \Delta m^2 L / E = \pi/2$

Atmospheric $\Delta m^2 = 2.5 \cdot 10^{-3} \text{ eV}^2$

$L = 500 \text{ km @ } 1 \text{ GeV}$

Solar $\Delta m^2 = 7 \cdot 10^{-5} \text{ eV}^2$

$L = 18000 \text{ km @ } 1 \text{ GeV}$

Consequences of 3-family oscillations:

Oscillations of 250 MeV neutrinos;

I There will be $\nu_\mu \leftrightarrow \nu_e$ oscillation at L_{atm}
(discovered by T2K)

$$P(\nu_\mu \leftrightarrow \nu_e)_{\text{max}} \approx \frac{1}{2} \sin^2 2\theta_{13} + \dots \text{ (small)}$$

II There will be CP violation

$$\text{CP: } P(\bar{\nu}_\mu \leftrightarrow \bar{\nu}_e) \neq P(\nu_\mu \leftrightarrow \nu_e)$$

III we do not know if the neutrino ν_1 which contains more ν_e is the lightest one (natural?) or not (inverted)

$P(\nu_\mu \leftrightarrow \nu_e)$

ν_e appearance

for $P(\bar{\nu}_\mu \rightarrow \bar{\nu}_e)$

- $\delta \rightarrow -\delta$
- $a \rightarrow -a$

$$P(\nu_\mu \rightarrow \nu_e) =$$

$$4c_{13}^2 s_{13}^2 s_{23}^2 \sin^2 \frac{\Delta m_{13}^2 L}{4E} \left(1 + \frac{2a}{\Delta m_{13}^2} (1 - 2s_{13}^2) \right) \quad \theta_{13} \text{ (Leading term)}$$

$$+ 8c_{13}^2 s_{12} s_{13} s_{23} (c_{12} c_{23} \cos \delta - s_{12} s_{13} s_{23}) \cos \frac{\Delta m_{23}^2 L}{4E} \sin \frac{\Delta m_{13}^2 L}{4E} \sin \frac{\Delta m_{21}^2 L}{4E} \quad \text{CPC}$$

$$- 8c_{13}^2 c_{12} c_{23} s_{12} s_{13} s_{23} \sin \delta \sin \frac{\Delta m_{23}^2 L}{4E} \sin \frac{\Delta m_{13}^2 L}{4E} \sin \frac{\Delta m_{21}^2 L}{4E} \quad \text{CPV}$$

$$+ 4s_{12}^2 c_{13}^2 (c_{12}^2 c_{23}^2 + s_{12}^2 s_{23}^2 s_{13}^2 - 2c_{12} c_{23} s_{12} s_{23} s_{13} \cos \delta) \sin \frac{\Delta m_{21}^2 L}{4E} \quad \text{Solar}$$

$$- 8c_{13}^2 s_{13}^2 s_{23}^2 \cos \frac{\Delta m_{23}^2 L}{4E} \sin \frac{\Delta m_{13}^2 L}{4E} \frac{a}{4E} (1 - 2s_{13}^2) \quad \text{Matter effect}$$

since I am coming back from Japan...

T2K, T2K-II and HyperK

Idea of T2K was born 1999-2001 hep-ex/0106019 combining:

- existing SuperKamiokande detector (50kton W.Č., 22.5 kton fiducial)
- JAERI-KEK Japanese Proton Accelerator Research Complex (JPARC) at TOKAI including a high power, 0.75MW/30GeV Proton Synchrotron neutrino beam from pion decay $\pi^+ \rightarrow \mu^+ \nu_\mu$
- baseline 295 km \rightarrow neutrino energy for first maximum is ~ 650 MeV achievable by pion-decay beam at 2.5 degrees off-axis

Off Axis Beam (another NBB option)

(ref.: BNL-E889 Proposal)

WBB w/ intentionally misaligned beam line from det. axis

Decay Kinematics

$$E_\nu = \frac{m_\pi^2 - m_\mu^2}{2(E_\pi - p_\pi \cos\theta)}$$

Quasi Monochromatic Beam with energy determined by beam geometry!

T2K Long Baseline Neutrino Oscillation Experiment

T2K collaboration (2014)

Discovery of appearance of electron neutrino

Near neutrino detector

- T2K collaboration ~500 collaborators from 59 institutions, 11 countries
- Funded in FY2004, Started measurements in 2010
- **First discovery of ν_e appearance in ν_{μ} beam**
- Best measurement of ν_{μ} disappearance
- **Opens the door for CP violation measurements**

Alain Blondel CHIPP winter School neutrino physics part
 • **Could be the key to matter in the universe!**

$\nu_\mu \rightarrow \nu_\mu$ and $\bar{\nu}_\mu \rightarrow \bar{\nu}_\mu$ disappearance

Neutrino

$$\Delta m_{32}^2 = [2.34, 2.75] \times 10^{-3} eV^2 (NH) \text{ at } 90\% \text{ CL}$$

$$\sin^2 \theta_{23} = [0.42, 0.61] (NH) \text{ at } 90\% \text{ CL}$$

Antineutrino

$$\Delta \bar{m}_{32}^2 = [2.16, 3.02] \times 10^{-3} eV^2 (NH) \text{ at } 90\% \text{ CL}$$

$$\sin^2 \bar{\theta}_{23} = [0.32, 0.70] (NH) \text{ at } 90\% \text{ CL}$$

Neutrino and antineutrino parameters are consistent

No evidence of CPT violation, NSI, etc

ν_e and $\bar{\nu}_e$ appearance

Present design of Hyper-K

Previous design

- ✓ Super-K-like structure
- ✓ 2 tanks with staging
(2nd tank assumed to be ready 6 years later)
- ✓ 1 tank will be;
 - 60m(H) × 74m(D)
 - Total volume: 260 kton
 - Fiducial volume(FV): 190 kton
~10 x Super-K FV
 - PMT coverage 40%, 40,000 ID-PMT, 6,700 OD-PMT
- ✓ The candidate site is ~8km south of SK (2.5 degree off axis beam, L=295km)

Photosensor Improvements

Photo Multipliers (PMTs)

- Efficiency x 2, Timing resolution x 1/2
- Pressure tolerance x 2 (>100m)
- Enhance $p \rightarrow \bar{\nu} K^+$ signal, solar ν , neutron signature of $np \rightarrow d + \gamma(2.2\text{MeV})$, ..

Super-K PMT

$$P_{ee}(L/E) = 1 - P_{21} - P_{31} - P_{32}$$

$$P_{21} = \cos^4(\theta_{13}) \sin^2(2\theta_{12}) \sin^2(\Delta_{21})$$

$$P_{31} = \cos^2(\theta_{12}) \sin^2(2\theta_{13}) \sin^2(\Delta_{31})$$

$$P_{32} = \sin^2(\theta_{12}) \sin^2(2\theta_{13}) \sin^2(\Delta_{32})$$

Locate 20kton, 75% coverage liq. scintillator detector at 1st solar disappearance max (50km)
 use interference between solar and atmospheric terms which is sensitive to the **sign of Δm^2_{23}**

Since disappearance is used, no sensitivity to δ_{CP} .

Challenge from energy scale/linearity/resolution!

Yellow Book

Neutrino Physics with JUNO

The Jiangmen Underground Neutrino Observatory (JUNO), a 20 kton multi-purpose underground liquid scintillator detector, was recently proposed with the determination of the neutrino mass hierarchy as a primary physics goal. The excellent energy resolution and the large fiducial volume anticipated for the JUNO detector offer exciting opportunities for addressing many important topics in neutrino and astro-particle physics. In this document, we present the physics motivations and the anticipated performance of the JUNO detector for various proposed measurements.

- **Reactor neutrino physics**
 - Mass hierarchy, precision measurements, (geo-neutrino),...
- **Astro-particle physics**
 - Supernova neutrino, diffused supernova neutrino background, solar neutrino
- **High energy events**
 - Atmospheric neutrino, nucleon decays, ...

1. Statistical error-->Target Mass: 20 ktons, biggest LS Detector

2. Best Energy Resolution for LS Detector: 3%

→ ~75% PMT: coverage

→ Photon Detection Efficiency double 30% Quantum Effi. + 90% Collection Efficiency of PMT

→Transparent LS

3. Energy and Vertex reconstruction and correction:

symmetrical structure, time and charge measurement by PMT

4. Energy range and linearity: PMT response and electronics

5. Background Radiation Rate, fiducial volume cut, Material, Clean consideration

JUNO sensitivity to Mass Hierarchy :
 «more than 3 σ in 6 years»

	Current	JUNO
Δm^2_{12}	3%	0.6%
Δm^2_{23}	5%	0.6%

700m deep

Supernova neutrinos

- Less than 20 events observed so far
- Assumptions:
 - Distance: 10 kpc (our Galaxy center)
 - Energy: 3×10^{53} erg
 - L_ν the same for all types
 - Tem. & energy
 - $T(\nu_e) = 3.5$ MeV, $\langle E(\nu_e) \rangle = 11$ MeV
 - $T(\nu_\mu) = 5$ MeV, $\langle E(\nu_\mu) \rangle = 16$ MeV
 - $T(\nu_x) = 8$ MeV, $\langle E(\nu_x) \rangle = 25$ MeV

Many types of events:

- $\nu_e + p \rightarrow n + e^+$, ~ 3000 correlated events
- $\nu_e + {}^{12}\text{C} \rightarrow {}^{12}\text{B}^* + e^+$, ~ 10-100 correlated events
- $\nu_e + {}^{12}\text{C} \rightarrow {}^{12}\text{N}^* + e^-$, ~ 10-100 correlated events
- $\nu_x + {}^{12}\text{C} \rightarrow \nu_x + {}^{12}\text{C}^*$, ~ 600 correlated events
- $\nu_x + p \rightarrow \nu_x + p$, single events
- $\nu_e + e^- \rightarrow \nu_e + e^-$, single events
- $\nu_x + e^- \rightarrow \nu_x + e^-$, single events

Water Cerenkov detectors can not see these correlated events

Energy spectra & fluxes of all types of neutrinos

Crossing point with DUNE & HyperK

The DUNE Collaboration

As of today:

1001 Collaborators

from

144 Institutes

Based on Liquid Argon Technology.

DUNE Primary Science Program

Focus on fundamental open questions in particle physics and astro-particle physics:

- **1) Neutrino Oscillation Physics**

- CPV in the leptonic sector
- Definitive determination of the Mass Hierarchy
- Precision Oscillation Physics (θ_{23} octant, ...) & testing the 3-flavor paradigm

- **2) Nucleon Decay**

- Targeting SUSY-favored modes, e.g. $p \rightarrow K^+ \bar{\nu}$

- **3) Supernova burst physics & astrophysics**

- Galactic core collapse supernova, sensitivity to ν_e

Very clean signals for Kaon decay.

DUNE Far Detector at SURF

Location:

Sanford Underground Research Facility

Cryostat outer steel structure

External (Internal) Dimensions
19.1m (16.9m) W x 18.0m (15.8m) H x 66.0m (63.8m) L

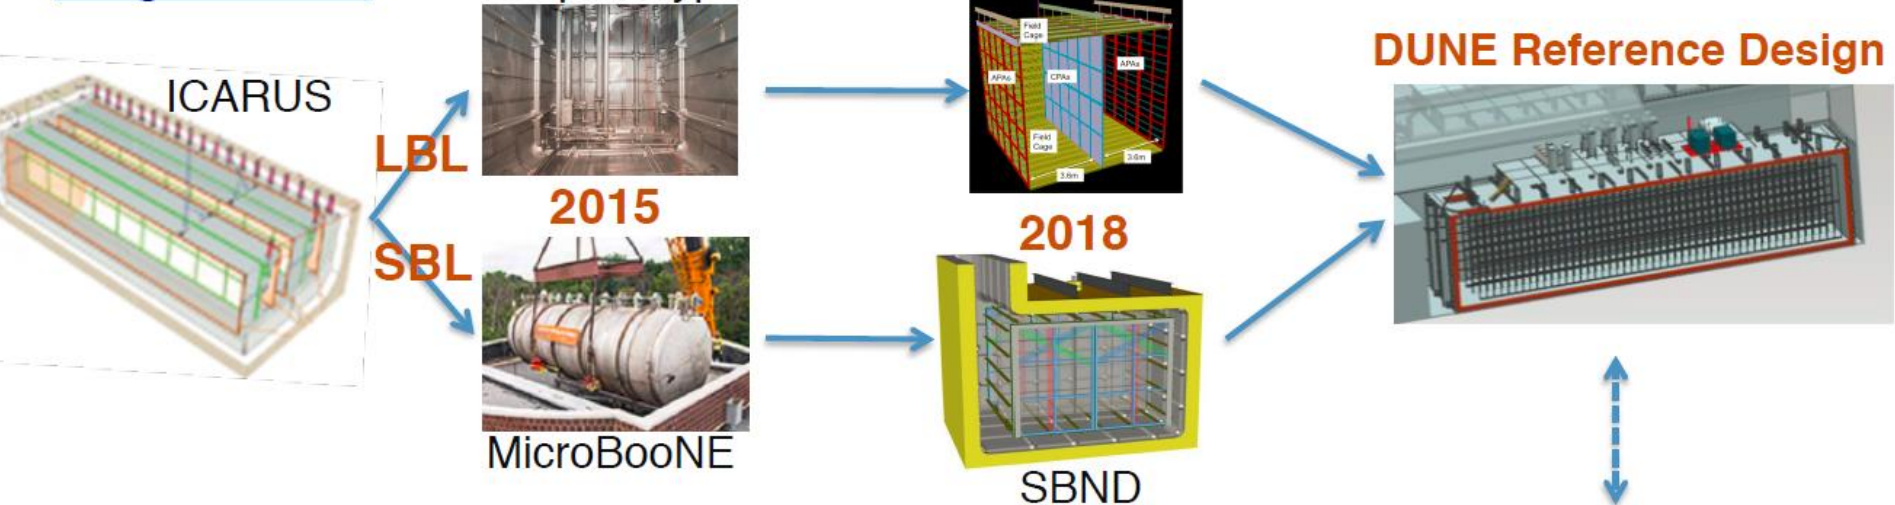

Can accommodate single and dual-phase LAr detectors

LArTPC Development Path

Fermilab SBN and CERN neutrino platform provide a strong LArTPC development and prototyping program

Single-Phase

Dual-Phase

LBNF and PIP-II

- ★ In beam-based long-baseline neutrino physics:
 - beam power drives the sensitivity
- ★ LBNF will be the world's most intense high-energy ν beam
 - Build on strong Fermilab track record (BNB & NuMI)
 - **1.2 MW from day one** (end 2026)
 - NuMI (MINOS) <400 kW
 - NuMI (NOVA) ultimately ~700 kW
 - **upgradable to 2.4 MW** After 6 years
- ★ Requires PIP-II (proton-improvement plan)
 - **\$0.5B** upgrade of FNAL accelerator infrastructure
 - Replace existing 400 MeV LINAC with 800 MeV SC LINAC

DUNE Schedule as of CDR <http://arxiv.org/abs/1601.05471>

Beam starts (with 1.2 MW capability) in 2026 with 2 detectors, upgrade to 2.4Mw ~6 yrs later.

CONCLUSIONS

Neutrinos offer so far the only Particle Physics signal beyond the Standard Model

The activities involve long baseline experiments with a strong program in US and Japan of

- Giant detector construction (HyperK, DUNE, also JUNO)**
- increase of (pulsed) proton beam power to 1.2 to 2.4 MW,
well beyond the best achieved so far (700kW at Fermilab 500 at JPARC)**

This should lead to the discovery of CP violation and the solution of the mass hierarchy in the next decade (2020-2035)

In parallel the search for the heavy right handed neutrinos (and other signs of a Majorana mass for neutrinos violating fermion number) will go full steam with

- search for neutrinoless double beta decay (ultrapure reaching 100 or 1000 tons)**
- direct search for heavy right handed neutrinos**

beam dump expt/SHIP

and the Future Circular Colliders (at CERN or in China)

We may thus understand the origin of neutrino masses, but also be given solutions for the Baryon Asymmetry of the Universe and even Dark Matter

or perhaps new world(s) of SM replicas

But Where Is Everybody?

930 Neutrinos: *the birth of the idea*

Pauli's letter of the 4th of December 1930

Dear Radioactive Ladies and Gentlemen,

As the bearer of these lines, to whom I graciously ask you to listen, will explain to you in more detail, how because of the "wrong" statistics of the N and Li6 nuclei and the continuous beta spectrum, I have hit upon a desperate remedy to save the "exchange theorem" of statistics and the law of conservation of energy. Namely, the possibility that **there could exist in the nuclei electrically neutral particles, that I wish to call neutrons, which have spin 1/2 and obey the exclusion principle** and which further differ from light quanta in that they do not travel with the velocity of light. **The mass of the neutrons should be of the same order of magnitude as the electron mass and in any event not larger than 0.01 proton masses.** The continuous beta spectrum would then become understandable by the assumption that in beta decay a neutron is emitted in addition to the electron such that the sum of the energies of the neutron and the electron is constant...

I agree that my remedy could seem incredible because one should have seen those neutrons very earlier if they really exist. But only the one who dare can win and the difficult situation, due to the continuous structure of the beta spectrum, is lighted by a remark of my honoured predecessor, Mr Debye, who told me recently in Bruxelles: "Oh, It's well better not to think to this at all, like new taxes". From now on, every solution to the issue must be discussed. Thus, dear radioactive people, look and judge.

Unfortunately, I cannot appear in Tübingen personally since I am indispensable here in Zurich because of a ball on the night of 6/7 December. With my best regards to you, and also to Mr Back.

Your humble servant

. W. Pauli

Received 19 October 1981

We present a high statistics measurement of the branching ratio for the decay $\tau^- \rightarrow \pi^- \nu_\tau$ using data obtained with the Mark II detector at the SLAC e^+e^- storage ring SPEAR. We have used events from the center-of-mass energy region 3.52 to 6.7 GeV to determine that $B(\tau^- \rightarrow \pi^- \nu_\tau) = 0.117 \pm 0.004 \pm 0.018$. From electron-muon events in the same data sample, we have determined that $B(\tau^- \rightarrow \pi^- \nu_\tau)/B(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau) = 0.66 \pm 0.03 \pm 0.11$. We present measurements of the mass and spin of the τ and the mass of the τ neutrino based, for the first time, on a hadronic decay mode of the τ .

Two body decay $\tau^- \rightarrow \pi^- \nu_\tau$ with $m(\nu_\tau) < 250$ MeV

The ratio $B(\tau^- \rightarrow \pi^- \nu_\tau)/B(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau) = 0.66 \pm 0.03 \pm 0.11$. is consistent with the tau being coupled to the hadronic weak axial-vector current

... and the life time of the tau is consistent with the emitted neutrino being >90% the isospin partner of the tau

Fig. 3. Pion energy spectrum for π -X events with bin-by-bin background subtraction and efficiency corrections. The curves are the expected spectra for $m_\tau = 1.782$ GeV/ c^2 , $m_\nu = 0$, and $B_\pi = 0.117$.

The tau neutrino was discovered in $e^+ e^-$ experiments

Asymptotic safety of gravity and the Higgs boson mass

Mikhail Shaposhnikov

Institut de Théorie des Phénomènes Physiques, École Polytechnique Fédérale de Lausanne, CH-1015 Lausanne, Switzerland

Christof Wetterich

Institut für Theoretische Physik, Universität Heidelberg, Philosophenweg 16, D-69120 Heidelberg, Germany

12 January 2010

Abstract

There are indications that gravity is asymptotically safe. The Standard Model (SM) plus gravity could be valid up to arbitrarily high energies. Supposing that this is indeed the case and assuming that there are no intermediate energy scales between the Fermi and Planck scales we address the question of whether the mass of the Higgs boson m_H can be predicted. For a positive gravity induced anomalous dimension $A_\lambda > 0$ the running of the quartic scalar self interaction λ at scales beyond the Planck mass is determined by a fixed point at zero. This results in $m_H = m_{\min} = 126$ GeV, with only a few GeV uncertainty. This prediction is independent of the details of the short distance running and holds for a wide class of extensions of the SM as well. For $A_\lambda < 0$ one finds m_H in the interval $m_{\min} < m_H < m_{\max} \simeq 174$ GeV, now sensitive to A_λ and other properties of the short distance running. The case $A_\lambda > 0$ is favored by explicit computations existing in the literature.

Key words:

Asymptotic safety, gravity, Higgs field, Standard Model

PACS: 04.60.-m 11.10.Hi 14.80.Bn

Detecting the Higgs scalar with mass around 126 GeV at the LHC could give a strong hint for the absence of new physics influencing the running of the SM couplings between the Fermi and Planck/unification scales.

$$P(\nu_e \rightarrow \nu_\mu) = |A|^2 + |S|^2 + 2 A S \sin \delta$$

$$P(\bar{\nu}_e \rightarrow \bar{\nu}_\mu) = |A|^2 + |S|^2 - 2 A S \sin \delta$$

$$\frac{P(\nu_e \rightarrow \nu_\mu) - P(\bar{\nu}_e \rightarrow \bar{\nu}_\mu)}{P(\nu_e \rightarrow \nu_\mu) + P(\bar{\nu}_e \rightarrow \bar{\nu}_\mu)} = A_{\text{CP}} \alpha \frac{\sin \delta \sin(\Delta m_{12}^2 L/4E) \sin \theta_{12} \sin \theta_{13}}{\sin^2 2\theta_{13} + \text{solar term...}}$$

... need large values of $\sin \theta_{12}$, Δm_{12}^2 (LMA) but *not* large $\sin^2 \theta_{13}$

... need APPEARANCE ... $P(\nu_e \rightarrow \nu_e)$ is time reversal symmetric (reactors or sun are out)

... can be **large** (30%) for suppressed channel (one small angle vs two large)

at wavelength at which 'solar' = 'atmospheric' and for $\nu_e \rightarrow \nu_\mu$, ν_τ

... asymmetry is opposite for $\nu_e \rightarrow \nu_\mu$ and $\nu_e \rightarrow \nu_\tau$
