

Cosmic matter in the laboratory – Science at FAIR

Peter Senger

Outline:

GSI highlights

Cosmic matter

Research at FAIR

Eötvös University, 7th December 2017, Budapest, Hungary

GSI Helmholtzzentrum für Schwerionenforschung

Employees: 1350

External scientists: 1000/year

Large scale accelerators and experiments

FAIR GmbH | GSI GmbH

Heavy-ion synchrotron SIS18

- Circumference: 216 m
- Acceleration: more than 100 000 turns per second
- Magnets: up to 1.8 T

Worldwide Cooperations in more than 50 countries

Research program

Nuclear physics (50%)

- Nuclear reactions
- hot and dense nuclear matter
- Superheavy elements

Biophysics and radiation physics (15%)

- Radiobiological effects of ions
- Tumor therapy twith ion beams

Material research (5%)

- Ion-material interaction
- Structuring of materials with ion beams

Atomic physics (15%)

- Atomic reactions
- Precision spectroscopy of highly charged ions

Plasma physics (5%)

- Hot and dense plasmas
- Ion-plasma interaction

Accelerator technology (10%)

- Linear accelerators
- Synchrotrons und storage rings

Superheavy elements

FAIR GmbH | GSI GmbH

Superheavy elements

Heidelberger Ionenstrahl-Therapiezentrum (HIT)

Heidelberger Ionenstrahl Therapiezentrum (HIT)

Inauguration Nov. 2, 2009 1000 patients per year

Facility for Antiproton and Ion Research: Cosmic matter in the laboratory > FAIR is worldwide the largest project in fundamental science. Forefront research in nuclear, hadron, atom, plasma, antimatter, and applied physics. > Member states: Germany, Russia, India, Poland, Romania, France, Finland, Sweden, Slovenia, Great Britain. ➤ 2500 – 3000 users per year. Total costs ca. 1.7 Mrd. €, full completion in 2025. Financing: Fed. Rep. Germany 60%, Hesse 10%, partner countries 30%

The soup of the first microsecond: quarks, antiquarks, electrons, positrons, gluons, photons

The evolution of stars

Black Hole

The Origin of Elements

Discovery of the first pulsar in 1968.

Crab nebula:

ashes of a core collapse supernova observed in 1054 by Chinese astronomers. The "visiting star" was as bright as the Venus for more than 20 days.

Fundamental questions What is the origin of the mass of the universe? What is the origin of the elements? What is the structure of neutron stars? Can we ignite the solar fire on earth? Does matter differ from antimatter ? Why do we not observe individual quarks ? \rightarrow to be explored at the future international Facility for Antiproton and Ion Research (FAIR)

NUclear STructure Astrophysics and Reactions

How are complex nuclei built from their basic constituents?

- What is the effective nucleon-nucleon interaction and how does QCD constrain its parameters?
- How does the three-nucleon force modify the picture?

How does the effective nuclear force depend on varying proton-to-neutron ratios?

- What is the isospin dependence of the spin-orbit force?
- How does shell structure change far from stability?
- How does the role of N-N correlations in nuclei and nuclear matter change with isospin?

How to explain collective phenomena from individual motion?

– What are the phases, relevant degrees of freedom, and symmetries of the nuclear many-body system?

What are the limits of existence of nuclei?

- Where are the proton and neutron drip lines situated?
- What are the heaviest elements?
- Which nuclei are relevant for astrophysical processes, what are their properties and what is their impact on nucleosynthesis modeling?
- How does the equation of state of nuclear matter change with neutron-to-proton asymmetry?
- How large is the symmetry energy and its density dependence?
- What are the properties of neutron-rich matter?

Nuclear structure research at FAIR

Nuclear Astrophysics at FAIR

Astrophysical site of heavy element production (r process) in the universe: Neutron star merger ! FAIR = = 1

- Electromagnetic "Kilonova" signal due to "r process" in neutron star merger theoretically predicted by GSI scientists in 2010.
- Confirmation by recent astronomical observations after gravitational wave detection from GW170817 (September 2017).
- Source of heavy elements including gold, platinum and uranium.

Exploring the QCD phase diagram

Exploring the QCD phase diagram

Courtesy of K. Fukushima & T. Hatsuda

Baryon Chemical Potential $\mu_{\rm B}$

At very high temperature:

- \succ N of baryons \approx N of antibaryons Situation similar to early universe
- L-QCD finds crossover transition between hadronic matter and Quark-Gluon Plasma at $T \approx 160 \text{ MeV}$
- Experiments: ALICE, ATLAS, CMS at LHC STAR, PHENIX at RHIC

Exploring the QCD phase diagram

Courtesy of K. Fukushima & T. Hatsuda

Baryon Chemical Potential $\mu_{\rm B}$

At high baryon density:

- N of baryons >> N of antibaryons Densities like in neutron star cores
 - Densities like in neutron star co
- L-QCD not (yet) applicable
- Models predict first order phase transition with mixed or exotic phases
- Experiments: BES at RHIC, NA61 at CERN SPS, CBM at FAIR, NICA at JINR

Density estimates

Atomic nucleus:

Radius $R = 1.2 \text{ fm } A^{1/3}$ ($\sigma_{reac} = \pi R^2$) Volume V = 4/3 $\pi R^3 = 4/3 \pi 1.2^3 \text{ A fm}^3$ Nucleon density $\rho_0 = A/V = 3/(4 \pi 1.2^3) \text{ fm}^{-3} \approx 0.14 \text{ fm}^{-3}$ Mass of nucleon m = 1.67 $\cdot 10^{-24} \text{ g}$ Mass density of cold nuclear matter $\rho_0 \cdot m \approx 270 \text{ Mio t/cm}^3$

Limits of nucleon density: Au-nucleus: $R \approx 7 \text{ fm}$, $V \approx 1400 \text{ fm}^3$ Nucleon: $R \approx 0.8 \text{ fm}$, $V \approx 2 \text{ fm}^3$ 200 Nucleons: $V \approx 400 \text{ fm}^3$ At $3 - 4 \rho^0$: nucleons overlap, Fermi see of quarks?

Neutron star:

Radius R \approx 10 km, Volume V \approx 4200 km³ Mass M \approx 2 solar masses = 2 \cdot 2 \cdot 10³³ g Average mass density ρ = M/V \approx 1000 Mio t/cm³ \approx 3.6 $\rho^{0} \cdot$ m Core density 5 – 10 times nuclear density

Quark matter in massive neutron stars?

CBM DAQ and online event selection

Novel readout system: no hardware trigger on events, detector hits with time stamps, full online 4-D track and event reconstruction.

FAIR Civil Construction

Civil construction (Status 2014)

The four most powerful drilling machines worldwide put down 1350 reinforced concrete pillars of 60 m depth and 1.2 m diameter.

FAIR Project Status 2017

- Successful restart in 2015 and 2016
- Comprehensive civil construction plan: completion of all buildings by 2022
- Full integrated planning for construction and commissioning of the entire project: Completion of the full FAIR facility by 2025.
- Civil construction as well as procurement of accelerators and realization of experiments are progressing well ...

Key Summary Recommendation of the NUPECC Long Range Plan 2017 presented in Brussels on Nov 27th :

Complete urgently the construction of the ESFRI* flagship FAIR and develop and bring into operation the experimental program of its four scientific pillars APPA, CBM, NUSTAR and PANDA.

FAIR is a European flagship facility for the coming decades. Worldwide unique it will allow for a large variety of unprecedented fore-front research in physics and applied science. It focuses on the structure and evolution of matter. Its multi- faceted research opens a new era in our understanding of the fundamental building blocks of matter and the forces as well as of the evolution of our Universe: the new possibilities for research in Darmstadt are unique and are expected to produce ground breaking new insights for nuclear research.
