A Large Ion Collider Experiment

## **SINGULARITY** @ ALICE

ALICE | Containers WG | 06-12-2017 | Miguel Martinez Pedreira

## REQUIREMENTS

- CVMFS => -B /cvmfs:/cvmfs
  - If to avoid setuid this is not doable, CVMFS provide ways to use *external* cache so it still shared as much as possible. Otherwise CVMFS inside the container, local caches (squids/stratums pushed)
  - Regarding image distribution (*unpacked*), is relevant to keep the infrastructure healthy, should offer same content from the container view
- /tmp used in analysis framework
  - Testing if setting \$TMPDIR for the payload cover all the grid use-cases
  - We would like to keep /tmp contained to avoid jobs polluting that area too much and bringing nodes down (black holes) => --contain or –B
    - Also we have seen how some nodes/batches had shared files, credentials, and undesired stuff in /tmp too
- Workdir/\$PWD of the job => mkdir ./alien-job-\$id and -B ./alien-job-\$id:/workdir

(or whatever agreed folder name)

- We have a 2-layer pilot: the first one does only matching; the second one prepares job files and environment and runs the payload (and would prepare Singularity execution). Credentials passed safely between the layers (next slide)
- HEP\_OS\_libs => on image build

## PILOT

		One slot
	Batch queue agent	
	Isolate job execution from other jobs on the same WN	
	ALICE JobAgent Different identity from the job pilot submitter (token certificates with the JobAgent role - limited command set to this role)	
SIS	Isolate payload from the job agent	
Etecution in containers	ALICE job from TQ  #IExecutable  Executed with yet another token certificate issued for this job ID, restricting what the job can do to this particular job's requirements	

- Being developed only in new AliEn version (JAliEn)
- Plan to have first production site by April
