EARTHQUAKES IN NUMBERS

"Earthquakes don't kill people, buildings do".

This quote is from [Seismologists](#) who believes that human construction and buildings crashing down during earthquakes, are the cause of most deaths.

U.S.A.

CURRENT INITIATIVES

Gov. Jerry Brown has signed a 2016-2017 state budget that provides \$10 million to help launch a statewide earthquake early-warning system (5mins) called ShakeAlert

5 mins is the closest science and technology have reached to predicting earthquakes.

No Shaking Expected

States affected by earthquakes

US is spending \$10.5bn* annually on earthquakes

6.1bn **\$\$\$\$\$** building stock losses

3.5bn **\$\$\$\$\$** capital losses

0.9bn **\$\$\$\$\$** income losses

* numbers vary depending on region

2017, Federal Emergency Management Agency

BEFORE

FIRST HOUR

SYSTEM MAP

CURRENT SITUATION

Develop safety protocols (e.g. building materials, etc)

Provide main power for building checks and danger categorisation

Organise disaster trainings

Allocate disaster points

Fund research entities to pursue projects

Project commissioning

Publish reports

Conferences and seminars

Training sessions, materials

Publish reports

Purchase emergency kit (first aid, medicines, batteries, etc)

Supermarkets

Online Retailers

NGOs organise awareness campaigns

Conferences, talks

Awareness website

Seismic Reporting Network publishes earthquake Bulletin & Catalogue

Seismology Centres create digital seismic waveform data sets

Physicists & Geologists research and experiment

Academics create statistical models

Seismicity map, events catalogue

Real-time data-driven website

Detectors, related tech

Quest for information from the seismic centres

Enter emergency mode

Run out, protect, Panic

Rescue people around

Call relatives, friends and emergency relatives

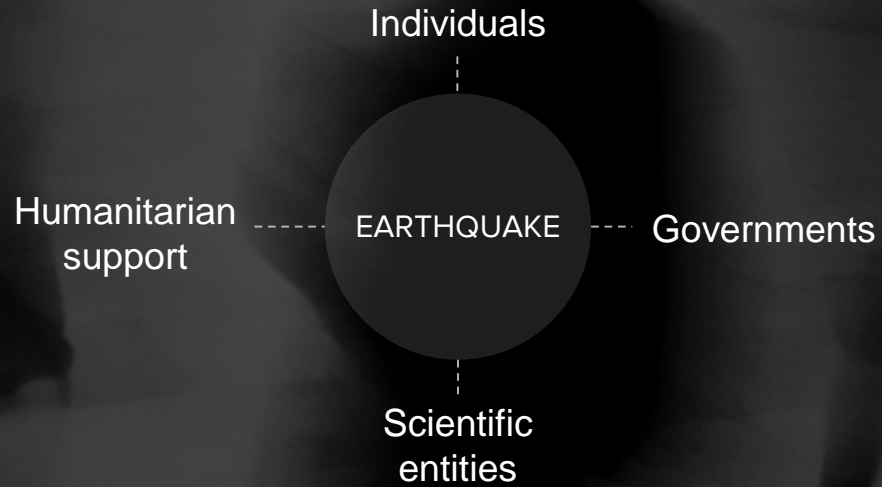

Detect location, depth and magnitude

Communicate information to relevant authorities

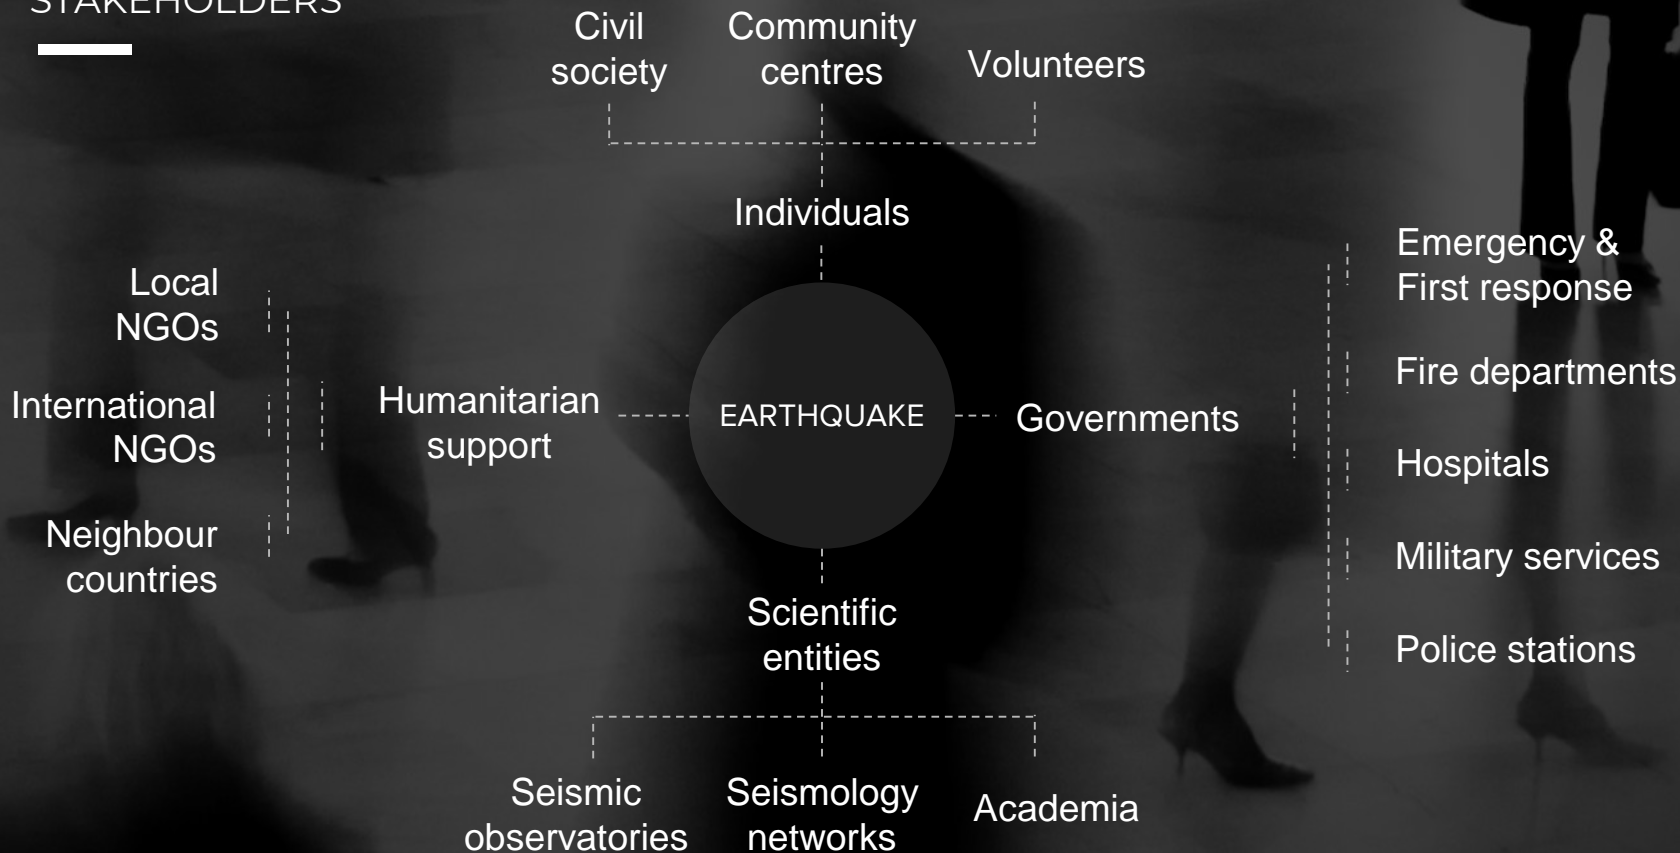

Media

Phone calls, press releases, social media

IN SYNTHESIS

—
NOW

SYSTEM ANALYSIS

CHALLENGES

01

LACK OF PREPAREDNESS
fast reaction mechanisms

02

DELAYS
in information and guidance
sharing

03

BUREAUCRATIC DELAYS
in planning and sending help

04

ACCESS DIFFICULTIES
12-24h delay for the help to reach
affected areas after the strike

SYSTEM ANALYSIS

OPPORTUNITIES

01

IMPROVE PREPAREDNESS
and fast reaction mechanisms

02

ELIMINATE DELAYS
by sharing information and
providing guidance on the spot

03

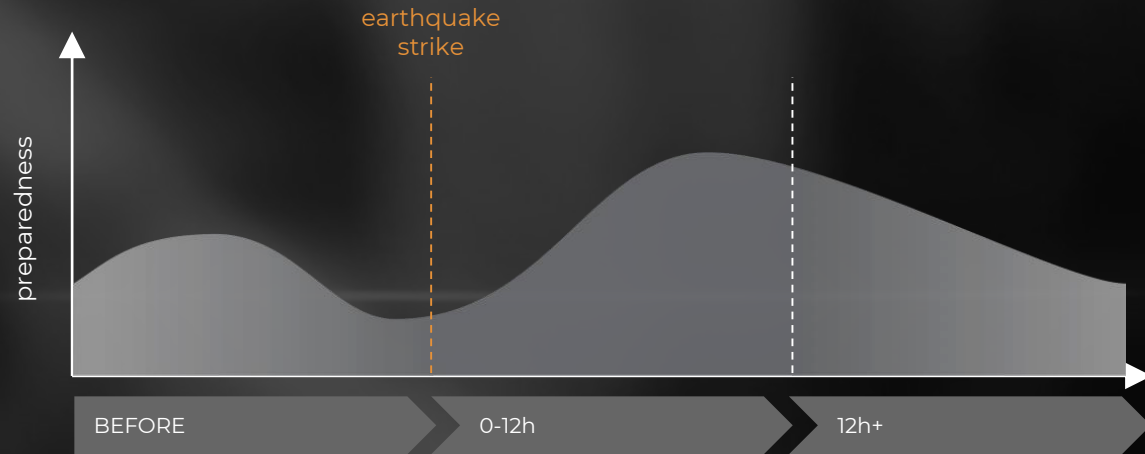

DECREASE DELAYS
calling response units in advance

04

SEND HELP IN ADVANCE
while the infrastructure and
transportation systems are not
damaged

IN SYNTHESIS

IN SYNTHESIS

FUTURE

WHAT ARE MUONS?

A specific subset of cosmic rays.

Heavy particles, **easily detectable**.
[mass ~207 times bigger than an electron]

MUON DETECTION

THE PROCESS

DECAY

A muon and a neutrino are the result of the decay of either positive or negative pions

MUON DETECTION

THE PROCESS

IONIZATION

Muons interact little with matter - but they interact with magnetic fields, deviating their trajectory

MUON DETECTION

THE PROCESS

DETECTION

The deviated trajectory can be detected, giving information about the material the muon passed through

MUON DETECTION

THE PROCESS

ELABORATION

The data collected is elaborated, highlighting the different levels of stress of the material analysed

MUON DETECTION

WHY

we should be able to predict that an earthquake is going to strike
with **6 - 8 hours of advance.**

Gusev, G., Zhukov, V. et al. (2011). Cosmic rays as a new instrument of seismological studies. *Bulletin of the Lebedev Physics Institute*, 38(12), pp.374-379.

MUON DETECTORS

01

Cosmic Pi - \$300

The Cosmic Pi project aims to build the world's largest open source distributed cosmic ray telescope.

02

Cosmic Watch - \$100

A [detector](#) that sits on a desk and tallies the muons that pass by. The whole system can be built by students.

03

Muon scattering tomography

Scientists use muon tomography in various applications, by differentiating cavities from solid structures.

OPPORTUNITY STATEMENT

—
HOW MIGHT WE STRENGTHEN
EARTHQUAKE EMERGENCY RESILIENCE,
BY IMPROVING PREPAREDNESS SYSTEMS?

ORBIS

WHAT WE OFFER

VISION

Our service merges low cost distributed muon flux detectors with a strong network of muon data processing and earthquake support system, for faster reaction rates.

WHAT WE OFFER

VISION

We aim to shift the earthquake response time before the disaster strikes, by enhancing the detection technologies and capabilities according to each country's needs.

WHAT WE OFFER

HOW

HARDWARE

Affordable server rack based solution

NETWORK

Data collection network

SUPPORT

Information and humanitarian

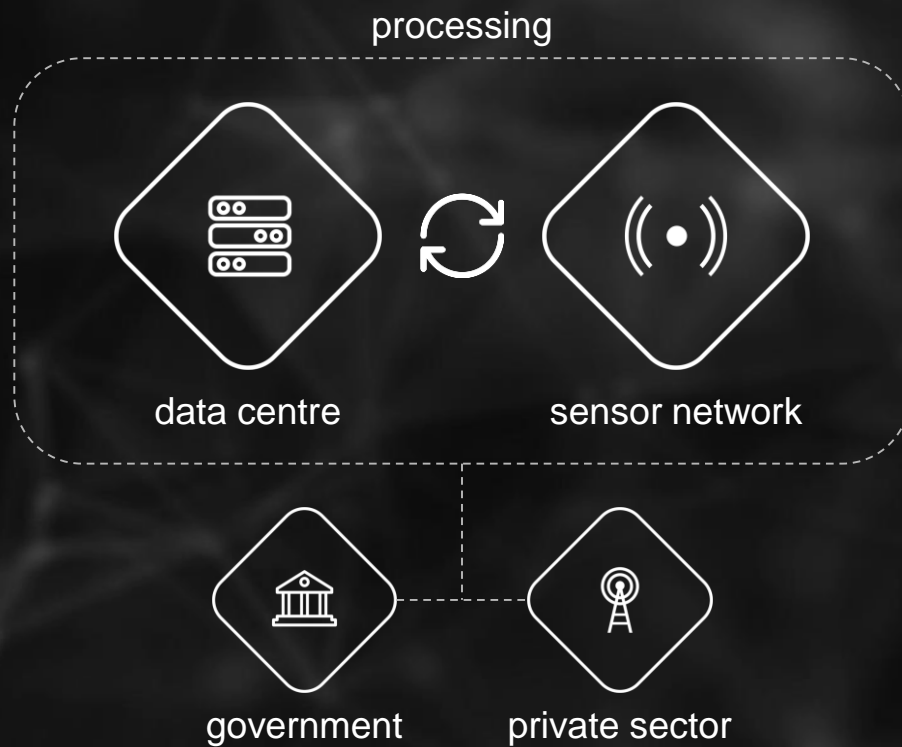

SERVICE PROPOSITION

HOW

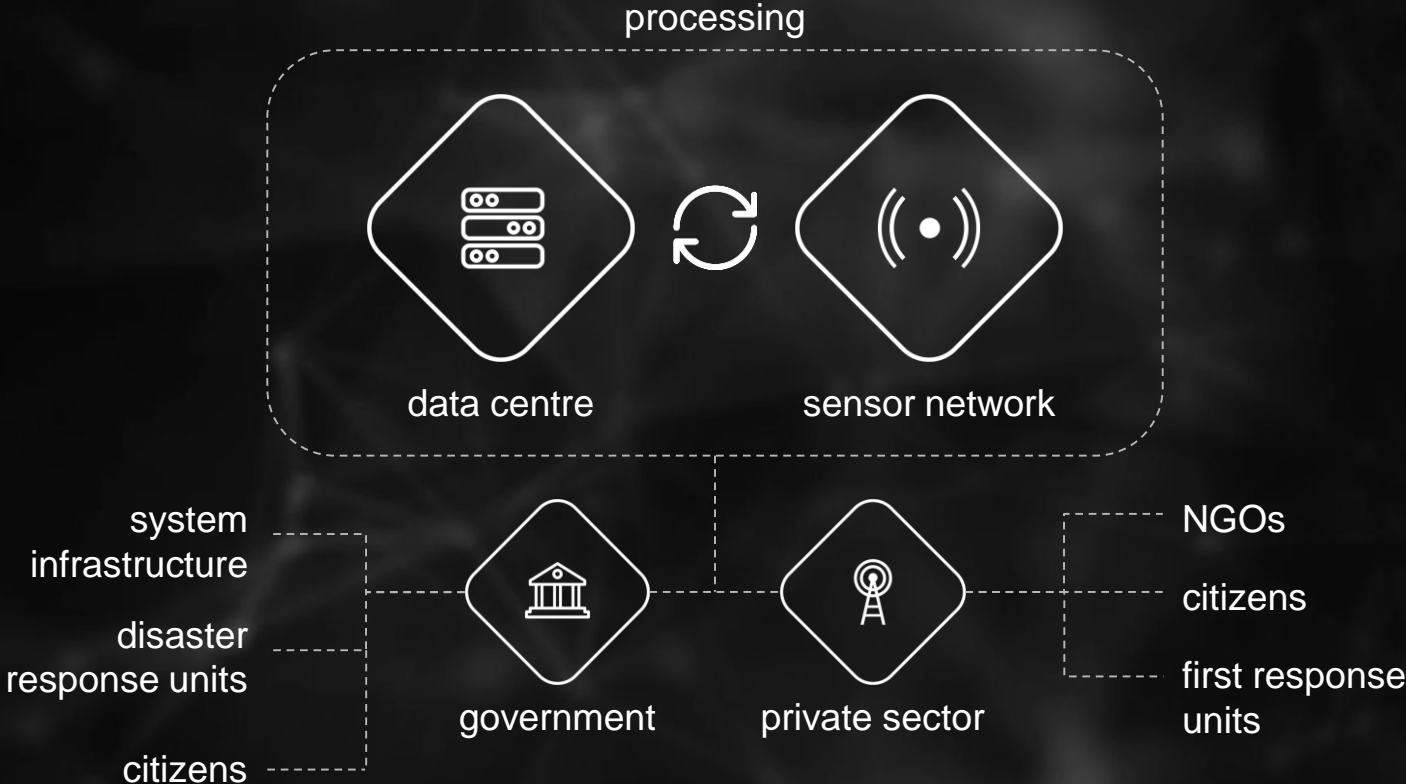

SERVICE PROPOSITION

HOW

SERVICE PROPOSITION

HOW

01

Enhance the implementation capacity

02

Increase emergency preparedness

03

Build disaster resilience

THE SERVICE

OUR GOALS

JOURNEY

STORYBOARD

01

Constantly collecting muon activity data
using our server rack sensors

Muon Activity Detection

Santiago Network

Reaction Time

Irregular Activity

02

Analysing the data. Muon irregular activity is detected and region affected is pinpointed

EL GOBIERNO PARA

TENDENCIAS

CNN CHILE

NACIONAL

ECONOMÍA

07

Aid NGOs are informed and deployed before the earthquake strikes

08

People are safe during the earthquake

09

External help and funding arrives knowing the amount of people that would be affected

IMPACT

LIVES SAVED

People are already safe in shelters during the strike

MONEY SAVED

Less expenses for patient care, heavy injured assistance, public worker insurance and disease outbreaks

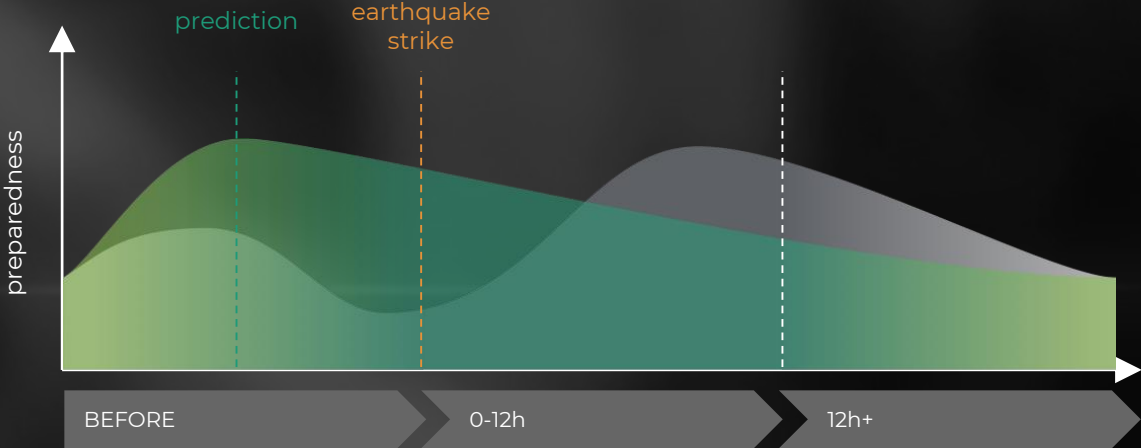

REACTION TIME REDUCED

Processes already mobilised before the strike
