Mass shift of charmonium states in $\bar{p}A$ collision

Tuesday 13 March 2018 11:00 (30 minutes)

The masses of the low lying charmonium states, namely, the J/Ψ , $\Psi(3686)$, and $\Psi(3770)$ are shifted downwards due to the second order Stark effect. In $\bar{p} + Au$ collisions at $6 - 10 \text{ GeV}$ we study their in-medium propagation. The time evolution of the spectral functions of these charmonium states is studied with a Boltzmann-Uehling-Uhlenbeck (BUU) type transport model. We show that their in-medium mass shift can be observed in the dilepton spectrum. Therefore, by observing the dileptonic decay channel of these low lying charmonium states, especially for $\Psi(3686)$, we can gain information about the magnitude of the gluon condensate in nuclear matter. This measurement could be performed at the upcoming PANDA experiment at FAIR.
