Improved studies of B—>D(*) tau nu with vertexing at Belle II

Saturday 7 July 2018 14:45 (15 minutes)

BABAR, Belle, and LHCb measure the rates for the decays $B \to D^{(*)}\tau\nu$ and $B_c \to J/\psi\tau\nu$ to be higher than the SM expectations, with a combined discrepancy of 4.1 σ (for $B \to D^{(*)}\tau\nu$ only) or $\sim 4.3\sigma$ (including all modes). In the coming years, Belle II and LHCb will greatly improve the measurement precision, to the level that systematic uncertainties associated with the background $B \to D^{**}\ell\nu$ become critical. We show how to utilize Belle II's high spatial resolution to obtain a model-independent handle on this background and improve the overall signal-backgroud. We also study the impact of vertexing on Belle II's capability to perform this measurement with the decay $\tau \to 3\pi\nu$, as already demonstrated by LHCb.
