

The Mu2e crystal calorimeter

Saturday 7 July 2018 11:36 (12 minutes)

The Mu2e experiment at Fermilab will search for the charged-lepton flavour violating neutrino-less conversion of a negative muon into an electron in the field of an aluminum nucleus.

The Mu2e detector is composed of a tracker and an electromagnetic calorimeter and an external veto for cosmic rays.

The calorimeter plays an important role in providing excellent particle identification capabilities, a fast online trigger filter while aiding the track reconstruction capabilities.

The calorimeter requirements are to provide a large acceptance for ~ 100 MeV electrons and reach:

- 1) a time resolution better than 0.5 ns @ 100 MeV;
- 2) an energy resolution $O(10\%)$ @ 100 MeV;
- 3) a position resolution of 1 cm.

The calorimeter consists of two disks, each one made of 674 undoped CsI crystals readout by two large area 2×3 array of UV-extended SiPMs of 6×6 mm² dimensions.

A large scale prototype has also been constructed and tested at the beam test facility in Frascati.

It consists of 51 pre-production crystals readout by two Mu2e SiPM.

We present the progresses done to complete the calorimeter design as well as a summary of results obtained in the production of components and on the test beam of the prototype.
