

A Cosmic Ray Detector for the Mu2e Experiment at Fermilab

Friday, July 6, 2018 8:15 PM (15 minutes)

The Mu2e experiment is designed to search for the charged-leptonflavor-violating process, μ^- to a e^- , with unprecedented sensitivity. The single 105-MeV electron that results from this process can be mimicked by electrons produced by cosmic-ray muons traversing the detector. An active veto detector surrounding the apparatus is used to detect incoming cosmic-ray muons. To reduce the backgrounds to the required level it must have an efficiency of about 99.99% as well as excellent hermeticity. The detector consists of four layers of scintillator counters, each with two embedded wavelength-shifting fibers, whose light is detected by silicon photomultipliers. The design and expected performance of the cosmic ray veto detector will be described.
