

$t\bar{t}H(bb)$ in leptonic final state with CMS

Friday 6 July 2018 20:15 (15 minutes)

We present a search for the standard model Higgs boson decaying into b quarks and produced in association with a pair of top quarks in the leptonic final states. This search has been performed on the full 13-TeV dataset of proton-proton collisions collected by the CMS experiment at the LHC in 2016. To separate the $t\bar{t}H$ signal from the irreducible $t\bar{t} + b\bar{b}$ background, this analysis takes advantage of several different innovative methods that are a Deep Neural Network (DNN), a Matrix Element Method (MEM), and a Boosted Decision Tree (BDT).
