

## New Results from Double Chooz

*Saturday 7 July 2018 11:00 (15 minutes)*

The reactor neutrino experiment Double Chooz observes electron-antineutrinos from two French power plants at Chooz with two identical detectors at different baselines. From the observed neutrino deficit the mixing angle  $\theta_{13}$  can be determined within the three flavour-scenario and signatures from further generations can be searched for. We will report the status of the experiment and present new results.
