

Search for Sterile Neutrinos at RENO

Friday 6 July 2018 20:15 (15 minutes)

The RENO experiment has successfully measured θ_{13} using the disappearance of electron anti-neutrinos in three-flavor neutrino oscillations. We search for sterile neutrinos in four-flavor oscillation model using roughly 1500 days of data collected by the RENO experiment. We have not seen any positive signal and obtain an excluded region of the oscillation parameters. We present an excluded contour plot in $\sin^2(2\theta_{14})-m_{41}^2$ space.
