## Hadronic Decays of $D^{0(+)}$ and $D_s^+$ at $\mathbb{H}_s$

## Liaoyuan Dong

Institute of High Energy Physics, Beijing

(On behalf of the **₩SII** collaboration)

#### **Outline**

- Introduction
  - ➤ The **ES** experiment
  - Production near threshold and tag technique
- ullet Hadronic decays of  $D_{(s)}$ 
  - Observation of pure W-annihilation decays:

$$D_s^+ o p \bar n,\, D_s^+ o \omega \pi^+,\, D_s^+ o a_0(980)\pi$$

 $\blacktriangleright$  Amplitude analysis of  $D \to K\pi\pi\pi$ :

$$D^0 o K^-\pi^+\pi^+\pi^-,\, D^0 o K^-\pi^+\pi^0\pi^0,\, D^+ o K_s^0\pi^+\pi^+\pi^-$$

Measurement of the branching fractions(BFs) of

$$D o PP$$
 (P=pseudo-scalar)

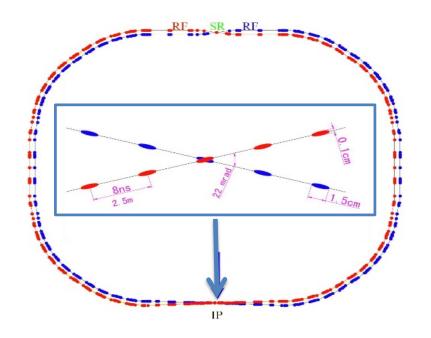

Summary

## The **E**S**II** Experiment

#### **Beijing-Electron-Positron Collider II (BEPCII)**

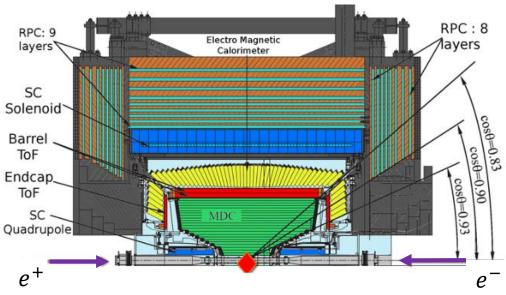

- $-e^+e^-$  collisions with  $\sqrt{s} = 2.0 4.6 GeV$
- Direct production of charmonia
- Designed Luminosity

$$\mathcal{L} = 1 \times 10^{33} cm^{-2} s^{-1}$$
 was achieved in April 2016.

#### **₩**S**II** detector

- 93% coverage of the full solid angle
- Main drift chamber  $\sigma_{
  m p}/{
  m p}=0.5\%@1{
  m GeV}$
- Time-of-flight system  $\sigma_T = 100 \mathrm{ps}$  in Barrel
- Elmg. Calorimeter  $\Delta E/E = 2.5\%$ @1GeV
- Superconducting 1T magnet
- Muon system (RPC)

#### Production near threshold and tag technique

#### Dataset used in this talk:

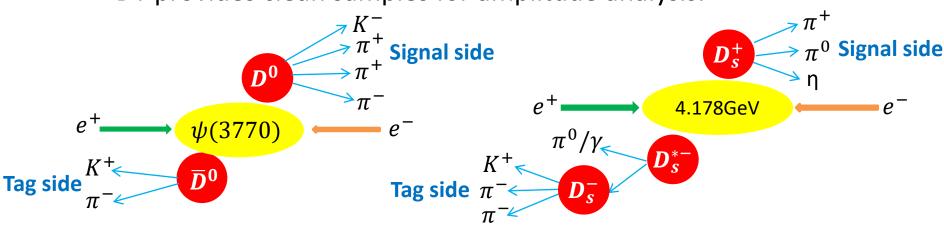

- 2.93 fb<sup>-1</sup> at Ecm = 3.773 GeV (~3.6x larger than CLEO's): D are produced via  $e^+e^- \rightarrow \psi(3770) \rightarrow D\bar{D}$
- 3.19 fb<sup>-1</sup> at Ecm = 4.178 GeV (~5.3x larger than CLEO's):  $D_s$  are produced mostly via  $e^+e^- \rightarrow D_s^{\pm}D_s^{*\mp}, D_s^{*\mp} \rightarrow \pi^0/\gamma D_s^{\mp}$

#### Two ways to study $D_{(s)}$ decays:

- Single Tag (ST): reconstruct only one of the  $D\bar{D}$  ( $D_s^+D_s^-$ )
- **Double Tag (DT):** reconstruct both of  $D\bar{D}$  ( $D_s^+D_s^-$ )

DT provides access to absolute BFs.

DT provides clean samples for amplitude analysis.

## Observation of pure W-annihilation decay

$$D_s^+ o p ar n$$

- $D_s^+ o p ar n$  is the only baryonic decay of charmed meson and can proceed only through W-annihilation process,
  - Short-distance expected: BF~10<sup>-6</sup>

PLB663(2008)326

Long-distance enhance to: BF~10<sup>-3</sup>

The large BF ( $^{10^{-3}}$ ) indicates large final state interaction(FSI) effect and is important to understand the dynamical enhancement of W-annihilation.

• First evidence was reported by CLEO with a signal of  $13.0 \pm 3.6$  events with  $BF = (1.30 \pm 0.36^{+0.12}_{-0.16}) \times 10^{-3}$  (PRL100, 181802(2008)).

## Observation of $D_s^+ \to p\bar{n}$

#### Tag modes:

Fit to the mass of missing particle 
$$M_{\text{miss}}$$
 to get the DT yield.

 $M_{miss}$  to get the DT yield.

# Preliminary 20 $M_{miss}(GeV/c^2)$

#### **Preliminary result:**

$$\mathcal{B}_{D_s^+ \to p\bar{n}} = (1.22 \pm 0.10) \times 10^{-3}$$

Statistical uncertainty only,

Statistically limited. Sys. dominated by baryon PID.

- Confirm CLEO's measurement with greatly improved precision.
- Consistent with "long-distance" expectation (PLB663, 326).

### Observation of pure W-annihilation decays

$$D_s^+ 
ightarrow \omega \pi^+, \, D_s^+ 
ightarrow a_0(980)\pi$$

- $D_s^+ o \omega \pi^+, \, D_s^+ o a_0(980)\pi$  can proceed only via W-annihilation process:
  - factorizable short-distance contribution is helicity suppressed,
  - non-factorizable long-distance contribution induced by FSI dominate,
     which makes the input from experimental measurement to be the unique method to determine the W-annihilation amplitude.
- With the measured BF of  $D_s^+ \to \omega \pi^+$  as one of the inputs , Q. Qin et al. (PRD89, 054006) predicts:

$$\mathcal{B}(D_s^+ \to \omega K^+) = 0.6 \times 10^{-3}, A_{\rm CP}(D_s^+ \to \omega K^+) = -0.6 \times 10^{-3}$$
 (without  $\rho - \omega$  mixing)  $\mathcal{B}(D_s^+ \to \omega K^+) = 0.07 \times 10^{-3}, A_{\rm CP}(D_s^+ \to \omega K^+) = -2.3 \times 10^{-3}$  (with  $\rho - \omega$  mixing)

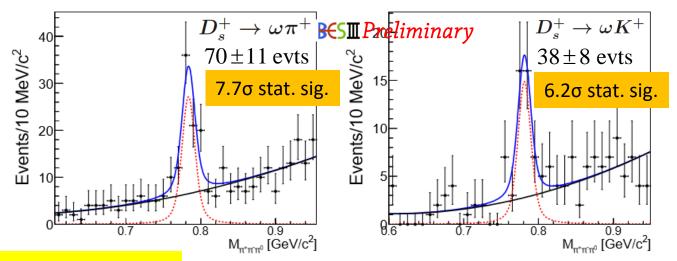

Among the largest expected  $A_{CP}$  observed in charmed decays

•  $D_s^+ \to \omega \pi^+$ : Evidence by CLEO, BF= $(2.1\pm 0.9\pm 0.1)\times 10^{-3}$  with a signal of  $6.0\pm 2.4$  events.  $D_s^+ \to \omega K^+$ : CLEO set an UL =  $2.4\times 10^{-3}$  @90% C.L. (PRD80, 051102(R) (2009))

## Observation of $D_s^+ o \omega \pi^+$ and $D_s^+ o \omega K^+$

- Tag modes:  $D_s^- \to K_S^0 K^-, D_s^- \to K^+ K^- \pi^-$ . Total ST yield ~ 0.167M.
- Double tag: average mass of two  $D_s$  mesons closest to the PDG value.

Fit to the invariant mass  $M_{\pi^+\pi^-\pi^0}$  to get the DT yield:

#### **Preliminary results:**

Consistent with CLEO's measurement, but more precise.

$$\mathcal{B}(D_s^+ \to \omega \pi^+) = (1.85 \pm 0.30_{stat.} \pm 0.19_{sys.}) \times 10^{-3}$$
 
$$\mathcal{B}(D_s^+ \to \omega K^+) = (1.13 \pm 0.24_{stat.} \pm 0.14_{sys.}) \times 10^{-3}$$
 First observation!

• The measurement of  $D_s^+ o \omega K^+$  implies the  $\rho - \omega$  mixing is negligible.

## Amplitude analysis of $D_s^+ \to \pi^+ \pi^0 \eta$

#### Events are selected with double tag:

Tag modes:

$$D_s^- \to K_S^0 K^-, D_s^- \to K^+ K^- \pi^-, D_s^- \to K_S^0 K^- \pi^0, D_s^- \to K^+ K^- \pi^- \pi^0, D_s^- \to K_S^0 K^+ \pi^- \pi^-, D_s^- \to \pi^- \eta_{\gamma\gamma}, D_s^- \to \pi^- \eta'_{\pi^+ \pi^- \eta}$$

#### Data sample for amplitude analysis:

- A Multi-variate analysis is performed to suppress the background from fake  $\eta$ .
- The retained data sample has 1239 events with a purity of  $(97.7 \pm 0.5)\%$ .

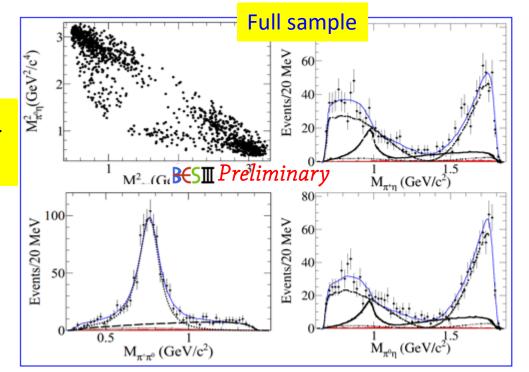

## Observation of $D_s^+ \to a_0(980)\pi$

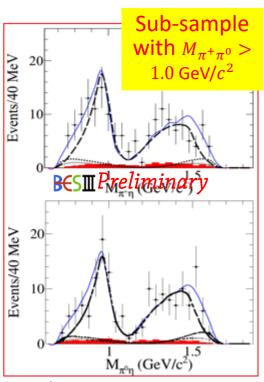

**Preliminary**: significances, phases, and fit fractions (FFs) for intermediate processes:

Amplitude	Significance ( $\sigma$ )	Phase	FF
$D_s^+ \to \rho^+ \eta$	> 20	0.0 (fixed)	$0.783 \pm 0.050 \pm 0.021$
$D_s^+ \to (\pi^+\pi^0)_V \eta$	5.7	$0.612 \pm 0.172 \pm 0.342$	$0.054 \pm 0.021 \pm 0.026$
$D_s^+ \to a_0(980)\pi$	16.2	$2.794 \pm 0.087 \pm 0.041$	$0.232 \pm 0.023 \pm 0.034$

The amplitudes agree with:  $A(D_s^+ \to a_0(980)^+\pi^0) = -A(D_s^+ \to a_0(980)^0\pi^+)$  within stat. uncertainty, thus we set the magnitudes to be the same with the phase difference fixed to  $\pi$ .

Dalitz plot & Projections:

10

Dots: data; solid: total fit; dashed:  $D_s^+ \to \rho^+ \eta$ ; long dashed:  $D_s^+ \to a_0(980)\pi$ 

## Branching Fraction Results of $D_s^+ \to \pi^+ \pi^0 \eta$

**200**F

Fit to the invariant mass  $M_{\pi^+\pi^0\eta}$  to get the DT yield.

Preliminary results:  $\mathcal{B}(D_s^+ \to \pi^+\pi^0\eta) = (9.50 \pm 0.28_{stat.} \pm 0.41_{sys.})\% \text{ } 50$ Fit to the invariant mass  $M_{\pi^+\pi^0 n}$  to

$$\mathcal{B}(D_s^+ \to \pi^+ \pi^0 \eta) = (9.50 \pm 0.28_{stat.} \pm 0.41_{sys.})\%_{\text{I}}$$
  
PDG value =  $(9.2 \pm 1.2)\%$ 

BF(sub-mode 
$$n$$
) =  $\mathcal{B}(D_s^+ \to \pi^+ \pi^0 \eta) FF(n)$ 

Branching fraction (%)	<b>B€SII</b> Preliminary
$\mathcal{B}(D_s^+ \to \rho^+ \eta) = 7.44 \pm 0.48$	$stat. \pm 0.44 sys.$
$\mathcal{B}(D_s^+ \to a_0(980)\pi)^* = 2.20$	
$\mathcal{B}(D_s^+ \to a_0(980)^+ \pi^0)^* = 1.4$	$46 \pm 0.15_{stat.} \pm 0.22_{sys.}$
$\mathcal{B}(D_s^+ \to a_0(980)^0 \pi^+)^* = 1.4$	$46 \pm 0.15_{stat.} \pm 0.22_{sys.}$

DT yield:  $2631\pm77$ **B€S** Preliminary  $M_{\pi^{+}\pi^{0}n}^{1.95}$  (GeV/c<sup>2</sup>) PDG value =  $(8.9 \pm 0.9)\%$ First observation!

\*here,  $a_0(980) \to \pi \eta$ Sys. dominated by  $\pi^0$  and  $\eta$  reconstruction (4%).

The measured  $\mathcal{B}(D_s^+ \to a_0(980)^+\pi^0)$  is larger than other measured pure W-annihilation decays (  $D_s^+ \to p\bar{n}, D_s^+ \to \omega \pi^+$ ) by one order.

This provides theoretical challenge in understanding such a large W-annihilation contribution in  $D \to SP$  (S=scalar; P=pseudo-scalar).

### Amplitude analysis of $D \to K\pi\pi\pi$

- The measurement of the sub-modes in  $D \to K\pi\pi\pi$  provides a window to study the decays  $D \to AP$  and  $D \to VV$  (A=axial-vector, V=vector), both of them are important in learning the CPV in charm decays but less effective experimental measurements.
- The knowledge of sub-modes can be widely used in many measurements:
   Branching fraction measurement
   Strong phase measurement
   CKM unitary triangle measurement
- There are seven  $D \to K\pi\pi\pi$  modes:

$$D^{0} \to K^{-}\pi^{+}\pi^{+}\pi^{-}, K^{-}\pi^{+}\pi^{0}\pi^{0}, K_{S}^{0}\pi^{+}\pi^{-}\pi^{0}, K_{S}^{0}\pi^{0}\pi^{0}\pi^{0} \text{ and } D^{+} \to K^{-}\pi^{+}\pi^{+}\pi^{0}, K_{S}^{0}\pi^{+}\pi^{+}\pi^{-}, K_{S}^{0}\pi^{+}\pi^{0}\pi^{0}.$$

Previous measurements of sub-modes in  $D^0 \to K^-\pi^+\pi^-\pi^-$ ,  $K^0_S\pi^+\pi^-\pi^0$  and  $D^+ \to K^-\pi^+\pi^+\pi^0$ ,  $K^0_S\pi^+\pi^+\pi^-$  have been perform by Mark III and E691. Both measurements are affected by low statistics.

• In this talk, we report the amplitude analysis results of  $D^0 \to K^-\pi^+\pi^+\pi^-, D^0 \to K^-\pi^+\pi^0\pi^0, D^+ \to K_s^0\pi^+\pi^+\pi^-$ 

#### Amplitude Analysis Results of $D^0 o K^-\pi^+\pi^+\pi^-$

**Double tag:** The  $D^0$  is reconstructed by  $K^-\pi^+\pi^+\pi^-$  with  $\overline{D}^0$  reconstructed by  $K^+\pi^-$ . PRD95,072010

A sample of 15912 events with purity ~99.4% is used to perform the amplitude analysis.

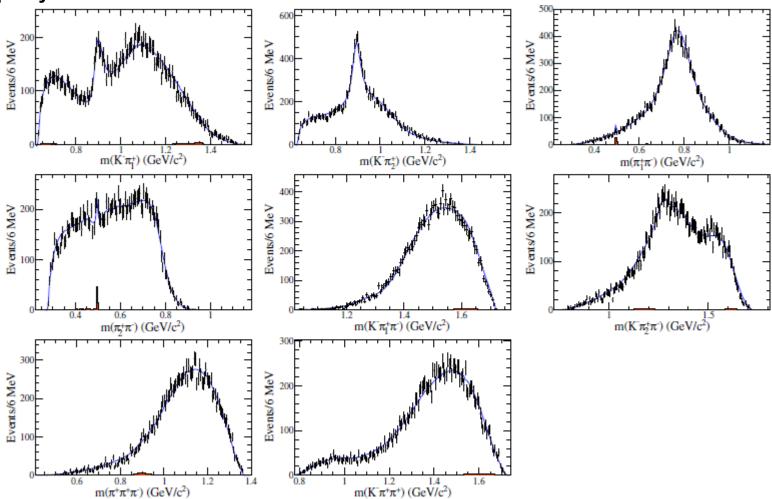

The data can be described with 23 amplitudes:

Amplitude	$\phi_i$	Fit fraction (%)
$D^0[S] \to \bar{K}^* \rho^0$	$2.35 \pm 0.06 \pm 0.18$	$6.5 \pm 0.5 \pm 0.8$

$D \to (K^-\pi^+)_{S\text{-wave}}(\pi^0\pi^0)_T$	$0.30 \pm 0.21 \pm 0.32$	$-2.93 \pm 0.31 \pm 0.82$
$D \to (K^- \pi^0)_{S\text{-wave}} (\pi^+ \pi^0)_T$	$0.14 \pm 0.12 \pm 0.10$	$2.23 \pm 0.38 \pm 0.65$

## Amplitude Analysis Results of $D^0 o K^-\pi^+\pi^0\pi^0$

#### Fit projections:

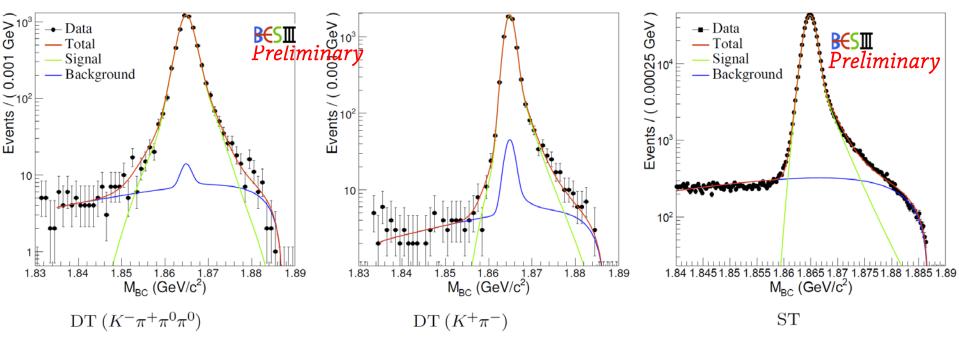

Points with error bars: data, red histograms: fit.

#### Branching Fraction Results of $D^0 o K^-\pi^+\pi^0\pi^0$

#### Fits to $M_{\rm BC}$ distributions of DT and ST data:

Beam-Constrained Mass: 
$$M_{\rm BC} = \sqrt{E_{\rm beam}^2 - |\vec{p}_D|^2}$$

Signal:  $M_{\rm BC}$  peaks at D mass

DT yield =  $6101\pm83$ ; ST yield =  $534581\pm769$ .

The amplitude analysis result is used to determine the detection efficiency.

#### **Preliminary result:**

$$\mathcal{B}(D^0 \to K^- \pi^+ \pi^0 \pi^0) = (8.98 \pm 0.13_{\text{stat.}} \pm 0.40_{\text{sys.}})\%$$

First measurement

## Amplitude Analysis Results of $D^+ o K^0_S \pi^+ \pi^+ \pi^-$

**Double tag:** The  $D^+$  is reconstructed by  $K_S^0 \pi^+ \pi^+ \pi^-$  with  $D^-$  reconstructed by  $K^+ \pi^- \pi^-$ .

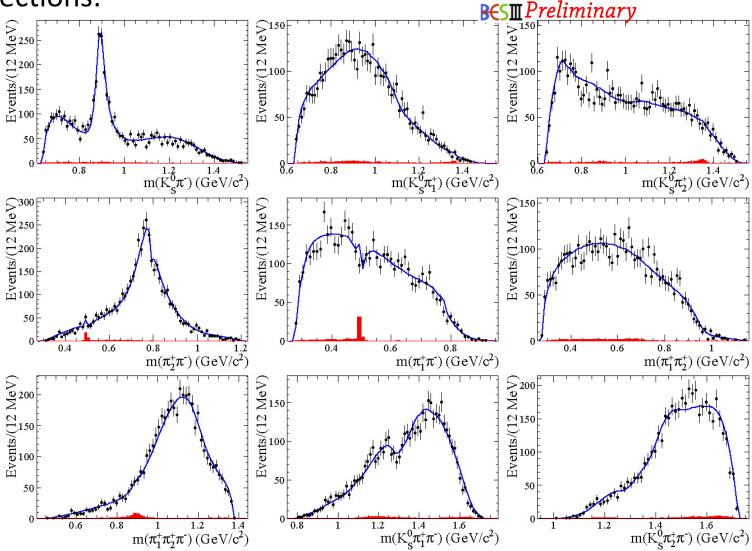

A sample of 4559 events with purity ~99% is used to perform the amplitude analysis.

The data can be described with 12 amplitudes:

		<b>B€SⅢ</b> Preliminary
Amplitude	$\phi$	Fit fraction
$D^+ \to K_S^0 a_1(1260)^+, a_1(1260)^+ \to \rho^0 \pi^+[S]$	0.000(fixed)	$0.567 \pm 0.020 \pm 0.044$
$D^+ \to K_S^0 a_1(1260)^+, a_1(1260)^+ \to f_0(500)\pi^+$	$-2.023 \pm 0.068 \pm 0.113$	$0.050 \pm 0.006 \pm 0.007$
$D^+ \to \bar{K}_1(1400)^0 \pi^+, \bar{K}_1(1400)^0 \to K^{*-} \pi^+[S]$	$-2.714 \pm 0.038 \pm 0.051$	$0.380 \pm 0.013 \pm 0.014$
$D^+ \to \bar{K}_1(1400)^0 \pi^+, \bar{K}_1(1400)^0 \to K^{*-} \pi^+ [D]$	$3.431 \pm 0.137 \pm 0.117$	$0.015 \pm 0.004 \pm 0.005$
$D^+ \to \bar{K}_1(1270)^0 \pi^+, \bar{K}_1(1270)^0 \to K_S^0 \rho^0[S]$	$-0.418 \pm 0.070 \pm 0.087$	$0.036 \pm 0.004 \pm 0.002$
$D^+ \to \bar{K}(1460)^0 \pi^+, \bar{K}(1460)^0 \to K_S^0 \rho^0$	$-1.850 \pm 0.120 \pm 0.223$	$0.014 \pm 0.004 \pm 0.003$
$D^+ \to (K_S^0 \rho^0)_A [D] \pi^+$	$2.328 \pm 0.097 \pm 0.068$	$0.011 \pm 0.003 \pm 0.002$
$D^+ \to K_S^0(\rho^0 \pi^+)_P$	$1.656 \pm 0.083 \pm 0.056$	$0.031 \pm 0.004 \pm 0.010$
$D^+ \to (K^{*-}\pi^+)_A[S]\pi^+$	$1.962 \pm 0.047 \pm 0.073$	$0.132 \pm 0.011 \pm 0.011$
$D^+ \to (K^{*-}\pi^+)_A[D]\pi^+$	$0.989 \pm 0.158 \pm 0.229$	$0.013 \pm 0.004 \pm 0.004$
$D^+ \to (K_S^0(\pi^+\pi^-)_S)_A\pi^+$	$-2.935 \pm 0.060 \pm 0.125$	$0.051 \pm 0.004 \pm 0.003$
$D^+ \to ((K_S^0 \pi^-)_S \pi^+)_P \pi^+$	$1.864 \pm 0.069 \pm 0.288$	$0.022 \pm 0.003 \pm 0.003$

## Amplitude Analysis Results of $D^+ o K_S^0 \pi^+ \pi^+ \pi^-$

Fit projections:

Points with error bars: data, red histograms: fit, green histograms: background estimated from MC.

For the two identical  $\pi^+$ , we require  $m(\pi_1^+\pi^-) < m(\pi_2^+\pi^-)$ .

## Branching fraction results of $D^+ o K^0_S \pi^+ \pi^+ \pi^-$

The preliminary results of branching fractions for different components:

	<b>B€SII</b> Preliminary
Component	Branching fraction (%)
$D^+ \to K_S^0 a_1(1260)^+ (\rho^0 \pi^+)$	$1.684 \pm 0.059 \pm 0.131 \pm 0.062$
$D^+ \to K_S^0 a_1(1260)^+ (f_0(500)\pi^+)$	$0.149 \pm 0.018 \pm 0.021 \pm 0.006$
$D^+ \to \tilde{K}_1(1400)^0 (K^{*-}\pi^+)\pi^+$	$1.105 \pm 0.045 \pm 0.048 \pm 0.041$
$D^+ \to \bar{K}_1(1270)^0 (K_S^0 \rho^0) \pi^+$	$0.107 \pm 0.012 \pm 0.006 \pm 0.004$
$D^+ \to \bar{K}(1460)^0 (K_S^0 \rho^0) \pi^+$	$0.042 \pm 0.012 \pm 0.009 \pm 0.002$
$D^+ \rightarrow K_S^0 \pi^+ \tilde{\rho}^0$	$0.131 \pm 0.015 \pm 0.015 \pm 0.005$
$D^+ \to K^{*-} \pi^+ \pi^+$	$0.413 \pm 0.036 \pm 0.059 \pm 0.015$
$D^+ \to K_S^0 \pi^+ \pi^+ \pi^-$	$0.220 \pm 0.015 \pm 0.024 \pm 0.008$
	<u> </u>
	stat. uncertainty from FF
	sys. uncertainty from FF
	uncertainties related to BF( $D^+  o K_S^0 \pi^+ \pi^+ \pi^-$ ) in PDG

• The measurements of the decays with  $K_1(1270)$  and  $K_1(1400)$  involved provide some experimental information in understanding the mixture of the two excited Kaons. (PLB707,116).

## Measurement of the Branching Fractions of $oldsymbol{D} o oldsymbol{PP}$

- The analysis of  $D \to PP$  modes provides materials for the study of SU(3) breaking effect.
- Most of the  $D \to PP$  decays have been studied by CLEO in 2010 , other measurements come from Belle , BABAR and CDF , etc.

BFs of  $D \rightarrow PP$  are obtained using ST method:

Mode	$\mathcal{B}$ (×10 <sup>-3</sup> )	$\mathcal{B}_{\text{PDG}}~(\times 10^{-3})$
$D^+  o \pi^+ \pi^0$	$1.259 \pm 0.033 \pm 0.023$	$1.24 \pm 0.06$
$D^+  o K^+ \pi^0$	$0.232 \pm 0.021 \pm 0.006$	$0.189 \pm 0.025$
$D^+ o\pi^+\eta$	$3.790 \pm 0.070 \pm 0.068$	$3.66 \pm 0.22$
$D^+  o K^+ \eta$	$0.151 \pm 0.025 \pm 0.014$	$0.112 \pm 0.018$
$D^+  o \pi^+ \eta^\prime$	$5.12 \pm 0.14 \pm 0.024$	$4.84 \pm 0.31$
$D^+  o K^+ \eta^\prime$	$0.164 \pm 0.051 \pm 0.024$	$0.183 \pm 0.023$
$D^+  o K_S^0 \pi^+$	$15.91 \pm 0.06 \pm 0.30$	$15.3 \pm 0.6$
$D^+ \rightarrow K_S^0 K^+$	$3.183 \pm 0.029 \pm 0.060$	$2.95 \pm 0.15$
$D^0  ightarrow \pi^+\pi^-$	$1.508 \pm 0.018 \pm 0.022$	$1.421 \pm 0.025$
$D^0 \rightarrow K^+ K^-$	$4.233 \pm 0.021 \pm 0.064$	$4.01 \pm 0.07$
$D^0  o K^\mp \pi^\pm$	$38.98 \pm 0.06 \pm 0.51$	$39.4 \pm 0.4$
$D^0  o K_S^0 \pi^0$	$12.39 \pm 0.06 \pm 0.27$	$12.0 \pm 0.4$
$D^0  o K_S^0 \eta$	$5.13 \pm 0.07 \pm 0.12$	$4.85 \pm 0.30$
$D^0  o K_S^0 \eta'$	$9.49 \pm 0.20 \pm 0.36$	$9.5\pm0.5$

The results from BESIII are consistent with the world average values within uncertainties. The BFs of  $D^+ \to \pi^+ \pi^0, K^+ \pi^0, \pi^+ \eta, \pi^+ \eta', K_S^0 \pi^+, K_S^0 K^+$  and  $D^0 \to K_S^0 \pi^0, K_S^0 \eta, K_S^0 \eta'$  are determined with improved precision.

#### **Summary**

**ESII** provides large data samples close to charm related threshold to study the  $D_{(s)}$  hadronic decays:

- Observation of pure W-annihilation decays  $D_s^+ \to p\bar{n}, D_s^+ \to \omega \pi^+, D_s^+ \to a_0(980)\pi$ 
  - ightharpoonup Our preliminary results on  $D_s^+ o p \bar n, D_s^+ o \omega \pi^+$  confirm CLEO's measurements with greatly improved precision.
  - $\blacktriangleright$  Our preliminary results on  $D_s^+ \to a_0(980)\pi$  are larger than other measured pure W-annihilation decays ( $D_s^+ \to p\bar{n}, D_s^+ \to \omega\pi^+$ ) by one order.
- ullet Amplitude analysis of  $D o K\pi\pi\pi$ :
  - $\triangleright$   $D^0 \rightarrow K^-\pi^+\pi^+\pi^-$  is published in PRD95,072010.
  - ► Preliminary results of  $D^0 \to K^- \pi^+ \pi^0 \pi^0$ ,  $D^+ \to K_S^0 \pi^+ \pi^+ \pi^-$  are obtained.  $\mathcal{B}(D^0 \to K^- \pi^+ \pi^0 \pi^0) = (8.98 \pm 0.13_{\text{stat.}} \pm 0.40_{\text{sys.}})\%$
- Branching fractions of  $D \to PP$ :

The BFs of 14 decay modes are published in PRD97,072004.

More measurements in  $D_{(s)}$  hadronic decays are coming.
