

### An experiment to measure BR( $K_L \rightarrow \pi^0 v \bar{v}$ ) at the CERN SPS

International Conference on High-Energy Physics Seoul, 7 July 2018

### Matthew Moulson – INFN Frascati For the KLEVER project

### $K \rightarrow \pi v \overline{v}$ in the Standard Model

FCNC processes dominated by Z-penguin and box amplitudes:

Extremely rare decays with rates very precisely predicted in SM:

- Hard GIM mechanism + pattern of CKM suppression  $(V_{ts}^* V_{td})$
- No long-distance contributions from amplitudes with intermediate photons
- Hadronic matrix element obtained from  $BR(K_{e3})$  via isospin rotation

|  | <b>SM predicted rates</b><br>Buras et al, JHEP 1511* | Experimental status  |
|--|--|--|
| $K^+ \rightarrow \pi^+ v \overline{v}$ | BR = (8.4 ± 1.0) × 10 <sup>-11</sup>                 | <b>BR = (17.3</b> $^{+11.5}_{-10.5}$ ) × 10 <sup>-11</sup><br>Stopped <i>K</i> <sup>+</sup> , 7 events observed<br>BNL 787/949, PRD79 (2009) |

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 2

### $K \rightarrow \pi v \overline{v}$ and the unitarity triangle

 $K^+ \rightarrow \pi^+ \nu \overline{\nu}$  (NA62)

3

#### Dominant uncertainties for SM BRs are from CKM matrix elements

$$BR(K^{+} \to \pi^{+} v \bar{v}) = (8.39 \pm 0.30) \times 10^{-11} \cdot \left[\frac{|V_{cb}|}{0.0407}\right]^{2.8} \cdot \left[\frac{\gamma}{73.2^{\circ}}\right]^{0.74}$$
Buras et al.,  

$$JHEP \ 1511$$

$$BR(K_{L} \to \pi^{0} v \bar{v}) = (3.36 \pm 0.05) \times 10^{-11} \cdot \left[\frac{|V_{ub}|}{3.88 \times 10^{-3}}\right]^{2} \cdot \left[\frac{|V_{cb}|}{0.0407}\right]^{2} \cdot \left[\frac{\sin \gamma}{\sin 73.2^{\circ}}\right]^{2}$$

Intrinsic theory uncertainties ~ few percent

Measuring both  $K^+$  and  $K_L$  BRs can determine the CKM unitarity triangle independently from *B* inputs

**KLEVER:** An experiment to measure BR( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018

### $K \rightarrow \pi v \overline{v}$ and new physics

### New physics affects BRs differently for $K^+$ and $K_L$ channels Measurements of both can discriminate among NP scenarios

- Models with CKM-like flavor structure
   Models with MFV
- Models with new flavorviolating interactions in which either LH or RH couplings dominate
  - –Z/Z' models with pure LH/RH couplings
  - -Littlest Higgs with *T* parity
- Models without above constraints

   Randall-Sundrum

#### By end of 2018 NA62 will reach a sensitivity of 20 SM $K^+ \rightarrow \pi^+ vv$ events

- Input to the European Strategy for Particle Physics
- Solid extrapolation to ultimate sensitivity of NA62 achievable after LS2

# Fixed target runs at the SPS

#### 2021 (Run 3): Intention to continue data taking with NA62

- Measure BR( $K^+ \rightarrow \pi^+ \nu \nu$ ) with ultimate sensitivity
- · Search for hidden particles in beam-dump mode

#### 2026 (Run 4): Turn focus to measurement of BR( $K_L \rightarrow \pi^0 vv$ ) $\rightarrow$ K<sub>L</sub>EVER

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 7

## $K_L \rightarrow \pi^0 v \bar{v}$ : Experimental issues

#### Essential signature: $2\gamma$ with unbalanced $p_{\perp}$ + nothing else!

All other  $K_L$  decays have  $\ge 2 \text{ extra } \gamma \text{s or } \ge 2 \text{ tracks to veto}$ Exception:  $K_L \rightarrow \gamma \gamma$ , but not a big problem since  $p_\perp = 0$ 

### $K_L$ momentum generally is not known $M(\gamma\gamma) = m(\pi^0)$ is the only sharp kinematic constraint

Generally used to reconstruct vertex position

#### Main backgrounds:

veto  $\gamma_1 d$  $R_1 \gamma_2$  $R_2$  $R_2$ 

$$m_{\pi^0}^2 = 2E_1 E_2 \left(1 - \cos\theta\right)$$

$$R_1 \approx R_2 \equiv R = \frac{d\sqrt{E_1 E_2}}{m_{\pi^0}}$$

| Mode                                | BR                             | Methods to suppress/reject                         |
|-------------------------------------|--------------------------------|--|
| $K_L  ightarrow \pi^0 \pi^0$        | <b>8.64 × 10</b> <sup>-4</sup> | $\gamma$ vetoes, $\pi^0$ vertex, $p_{\perp}$       |

#### **KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 8

# A $K_L \rightarrow \pi^0 v \bar{v}$ experiment at the SPS

400-GeV SPS proton beam (2 × 10<sup>13</sup> pot/16.8 s) incident on Be target at z = 0 m

*K<sub>L</sub>* Experiment for VEry Rare events

- High-energy experiment: Complementary to KOTO
- Photons from  $K_L$  decays boosted forward
  - Makes photon vetoing easier veto coverage only out to 100 mrad
- Roughly same vacuum tank layout and fiducial volume as NA62

# A $K_L \rightarrow \pi^0 v \bar{v}$ experiment at the SPS

400-GeV SPS proton beam (2 × 10<sup>13</sup> pot/16.8 s) incident on Be target at z = 0 m

# Beam and intensity requirements

# $K_L$ and $\Lambda$ fluxes in beam FLUKA simulation

- 400 GeV p on 400 mm Be target
- Production at  $\theta$  = 8.0 mrad:
  - As much  $K_L$  production as possible
  - Low ratio of  $n/K_L$  in beam ~ 3
  - Reduce *A* production and soften momentum spectrum
- Solid angle  $\Delta \theta = 0.4$  mrad
  - Large  $\Delta \theta = \text{high } K_L$  flux
  - Maintain tight beam collimation to improves p<sub>⊥</sub> constraint for background rejection

**60**  $K_L \rightarrow \pi^0 v v$  events

### • 2.1 × 10<sup>-5</sup> $K_L$ in beam/pot

- Probability for decay inside FV  $\sim 2\%$
- Acceptance for  $K_L \rightarrow \pi^0 v v$  decays occurring in FV ~ 10%

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 11

### Neutral beamline layout

- Compact primary beam sweeping
- Photon absorber in dump collimator
- 4 collimation stages to minimize neutron halo, including beam scattered from absorber
- Active final collimator in LYSO

## Neutral beam simulation

#### FLUKA simulation of beamline

32-mm tungsten coverter ( $9X_0$ )

Detail of target and dump collimator:

13

# Shashlyk calorimeter with spy tiles

### Main electromagnetic calorimeter (MEC):

Fine-sampling shashlyk based on PANDA forward EM calorimeter produced at Protvino

0.275 mm Pb + 1.5 mm scintillator

#### PANDA/KOPIO prototypes:

- σ<sub>E</sub>/√E ~ 3% /√E (GeV)
- $\sigma_t \sim 72 \text{ ps} / \sqrt{E} \text{ (GeV)}$
- $\sigma_x \sim 13 \text{ mm} / \sqrt{E} \text{ (GeV)}$

### New for KLEVER: Longitudinal shower information from spy tiles

- PID information: identification of  $\mu$ ,  $\pi$ , n interactions
- Shower depth information: improved time resolution for EM showers

1<sup>st</sup> prototype assembled and tested at Protvino OKA beamline, April 2018

## Vetoes for upstream $K_L \rightarrow \pi^0 \pi^0$

### **Upstream veto (UV):**

- 10 cm < *r* < 1 m:
- Shashlyk calorimeter modules à la PANDA/KOPIO, like MEC

### **Active final collimator:**

- 4.2 < *r* < 10 cm
- LYSO collar counter
- 80 cm long
- Internal collimating surfaces
- Intercepts halo particles from scattering on upstream collimators or  $\gamma$  absorber Rejects  $\pi^0$ s from inelastic interactions
- Rejects  $K_L \rightarrow \pi^0 \pi^0$  in transit through collimator

## Large-angle photon vetoes

### 25 new large-angle photon veto stations (LAV)

- 5 sizes, sensitive radius 0.85 to 1.5 m, at intervals of 4 to 5 m
- Hermetic coverage out to 100 mrad
   Need good detection efficiency at low energy (1 ε ~ 0.5% at 20 MeV)
- Baseline technology: Lead/scintillator tile with WLS readout Based on design of CKM VVS Assumed efficiency based on E949 and CKM VVS experience

# Small-angle photon veto

### Small-angle photon calorimeter system (SAC)

- Rejects high-energy  $\gamma$ s from  $K_L \rightarrow \pi^0 \pi^0$  escaping through beam hole
- Must be insensitive as possible to 430 MHz of beam neutrons

| Beam comp.              | Rate (MHz) | <b>Req. 1</b> – ε       |
|-------------------------|------------|-------------------------|
| γ, E > 5 GeV            | 50         | <b>10</b> <sup>-2</sup> |
| γ, E <b>&gt; 30 GeV</b> | 2.5        | 10 <sup>-4</sup>        |
| n                       | 430        | -                       |

### **Baseline solution:**

• Tungsten/silicon-pad sampling calorimeter with crystal metal absorber

# Efficient y conversion with crystals

Coherent effects in crystals enhance pair-conversion probability

Use coherent effects to obtain a converter with large effective  $\lambda_{int}/X_0$ :

- **1. Beam photon converter in dump collimator** Effective at converting beam  $\gamma$ s while relatively transparent to  $K_L$
- 2. Absorber material for small-angle calorimeter (SAC) Must be insensitive as possible to high flux of beam neutrons while efficiently vetoing high-energy  $\gamma$ s from  $K_L$  decays

### Beam test of $\gamma \rightarrow e^+e^-$ in crystals

AXIAL group is collaborating with KLEVER on test beam measurement of pair-production enhancement in crystals

Tagged photon test beam setup:

- 3. Measure pair conversion vs.  $E_{\gamma}$ ,  $\theta_{inc}$  for 5 <  $E_{\gamma}$  < 150 GeV
- 4. Obtain information to assist MC development for beam photon converter and SAC

- Nearly all detectors and DAQ system available for use from AXIAL
- 1 week of H2 beam in August 2018

**KLEVER:** An experiment to measure BR( $K_L \rightarrow \pi^0 vv$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 19

# **Charged particle rejection**

### Most dangerous mode: $K_{e3}$

- BR = 40%
- Easy to mistake  $e \leftrightarrow \gamma$  in LKr
- Acceptance  $\pi^0 v v / K_{e3} = 30$
- → Need 10<sup>-9</sup> suppression!

### **Charged particle veto (CPV)**

• Scintillating tiles, just upstream of MEC

### Calorimetric ID for $\mu$ and $\pi$

- Shower profile in MEC
- Re-use NA62 hadronic calorimeters MUV1/2 (not shown), downstream of MEC

### Mispaired $K_L \rightarrow \pi^0 \pi^0$ events

Distance from FV to LKr significantly helps for rejection of "odd" background from  $K_L \rightarrow \pi^0 \pi^0$ 

- Most  $K_L \rightarrow \pi^0 \pi^0$  decays with lost photons occur just upstream of the MEC
- " $\pi^0$ s" from mispaired  $\gamma$ s are mainly reconstructed upstream of true position

# Preshower detector (PSD) is particularly effective against downstream decays

## Preshower background rejection

Preshower vertex  $z_{pre}$  vs. LKr vertex  $z_{rec}$ 

**Even pairs** (2  $\gamma$  from same  $\pi^0$ )

 $z_{\rm rec}$  reconstructed by imposing  $M(\gamma\gamma) = m_{\pi 0}$ 

•  $K_L \rightarrow \pi^0 \pi^0$ , 1 year equivalent

• No cuts on FV,  $p_{\perp}$ ,  $r_{\min}$ 

**Odd pairs** (2  $\gamma$ s from different  $\pi^0$ )

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 22

### **Basic signal selection**

No hits in UV, AFC, LAV, SAC + fiducial volume (FV) and  $p_{\perp}$  cuts

**K<sub>l</sub>ever** 

### Additional background rejection

Cluster radius  $r_{MEC}$  > 35 cm – Require  $z_{PSD}$  in FV if PSD hit available

### Status and timeline

#### **Project timeline – target dates:**

| 2017-2018 | <ul> <li>Project consolidation and proposal</li> <li>Participation in Physics Beyond Colliders</li> <li>Beam test of crystal pair enhancement</li> <li>Input to European Strategy for Particle Physics</li> <li>Expression of Interest to CERN SPSC</li> </ul> |

### Most groups participating in NA62 have expressed interest in KLEVER We are actively seeking new collaborators!

**KLEVER:** An experiment to measure BR( $K_L \rightarrow \pi^0 vv$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 25

### Summary and outlook

Flavor will play an important role in identifying new physics, even if new physics is found at the LHC

 $K \rightarrow \pi v v$  is a uniquely sensitive indirect probe for high mass scales

Need precision measurements of both K<sup>+</sup> and K<sub>L</sub> decays

NA62 will improve on current knowledge of BR( $K^+ \rightarrow \pi^+ vv$ ) in the short term, ultimately reaching ~100 event sensitivity

KOTO will reach SM sensitivity to BR( $K_L \rightarrow \pi^0 vv$ ) by 2021

Preliminary design studies indicate that an experiment to measure BR( $K_L \rightarrow \pi^0 vv$ ) can be performed at the SPS in Run 4 (2026-2029)

- Many issues still to be addressed!
- Expected sensitivity: ~ 60 SM events with S/B ~ 1

### **KLEVER** is actively seeking new collaborators

- Expression of Interest to SPSC and input to ESPP in preparation
- Small contributions now can have a big impact!

### **Additional information**

### International Conference on High-Energy Physics Seoul, 7 July 2018

### Matthew Moulson – INFN Frascati For the KLEVER project

### $K \rightarrow \pi v \bar{v}$ and other kaon observables **K**

#### Do constraints from Re $\varepsilon'/\varepsilon$ , $\varepsilon_K$ , $\Delta m_K$ , $K_L \rightarrow \mu\mu$ limit size of effects on $K \rightarrow \pi \nu \nu$ BRs?

| Model              | Effect  | Refs                |
|--------------------|---|---------------------|
| Vector-like quarks | $K_L$ suppressed, $K^+$ possibly enhanced                               | Bobeth et al. '16   |
| Leptoquarks        | Large effects for both $K_L$ , $K^+$ : possibly ruled out?              | Bobeth, Buras '17   |
| Simplified Z       | $K_L$ suppressed 30%, $K^+$ enhanced up to 2x                           | Endo et al. '17     |
| SUSY               | $K^+$ and $K_L$ enhanced 10-20% for $\Lambda_{SUSY} \sim 3 \text{ TeV}$ | Kitahara et al. '16 |

#### Endo et al. PLB771 (2017)

General Z scenario with modified couplings,  $\Lambda = 1$  TeV

 Because of interference between SM and NP amplitudes, if all constraints satisfied including "discrepancy" in Re ε'/ε:

 $BR(K_L \rightarrow \pi^0 vv) \sim 0.5 SM BR$ 

- Particularly in simplified scenarios: LH, RH, LRS
- With moderate tuning (cancellation of interference terms to 10%), large values for BR( $K \rightarrow \pi v v$ ) are possible

### $K \rightarrow \pi v \overline{v}$ and other flavor observables **K**

New ideas relating  $K \rightarrow \pi v v$  to *B*-sector LFU anomalies:

 $R_{K}, P_{5}': \mu/e \text{ LFU in } B \to K\ell\ell, B \to K^{*}\ell\ell$  $R_{D(*)}: \tau/(\mu, e) \text{ LFU in } B \to D^{(*)}\ell\nu$ 

Coherent explanation from NP coupled predominantly to 3<sup>rd</sup> generation LH quarks and leptons, e.g., mediated by vector leptoquark

- Di Luzio et al. PRD 96 (2017)
- Buttazzo et al. JHEP 1711

EFT studies suggest large effect for  $K \rightarrow \pi v v$ 

• Bordone et al. EPJC77 (2017)

 $R_0 = \frac{1}{\Lambda^2} \frac{1}{\sqrt{2}G_F}$ 

$$\mathcal{B}(B \to D^{(*)}\tau\bar{\nu}) = \mathcal{B}(B \to D^{(*)}\tau\bar{\nu})_{\mathrm{SM}} \left| 1 + R_0 \left( 1 - \theta_q e^{-i\phi_q} \right) \right|^2$$

$$\mathcal{B}(K_L \to \pi^0 \nu \bar{\nu}) = 2\mathcal{B}(K_L \to \pi^0 \nu_e \bar{\nu}_e)_{\rm SM} + \mathcal{B}(K_L \to \pi^0 \nu_\tau \bar{\nu}_\tau)_{\rm SM} \left| 1 - \frac{R_0 \,\theta_q^2 (1 - c_{13})}{(\alpha/\pi)(X_{\rm t}/s_{\rm w}^2)} \right|^2$$

# High-intensity proton beam issues

10<sup>19</sup> pot/yr × 5 years  $\rightarrow$  2 × 10<sup>13</sup> ppp/16.8s = 6× increase relative to NA62

Feasibility/cost study a primary goal of our involvement in Physics Beyond Colliders

#### Preliminary analysis of critical issues by Secondary Beams & Areas group

| Issue                | Approach  |
|----------------------|---|
| Proton availability  | SHiP supercycle = $4 \times 10^{19}$ pot/yr with $1 \times 10^{13}$ ppp for users KLEVER requires $1 \times 10^{19}$ pot/yr (25% of SHiP)                 |
| Extraction losses    | Good results on ZS losses and spill quality from SPS Losses & Activation WG (SLAWG) workshop, 9-11 November 2017:<br>https://indico.cern.ch/event/639766/ |
| Beam loss on T4      | Vertical by-pass to increase transmission to T10  |
| Equipment protection | Interlock to stop SPS extraction during P0Survey reaction time  |
| Ventilation in ECN3  | Preliminary measurements indicate good air containment<br>Comprehensive ventilation system upgrade not needed?  |
| ECN3 beam dump       | Significantly improved for NA62<br>Need to better understand current safety margin  |
| Background fluxes    | Starting simulations for prompt background above target 8 mrad vertical targeting angle should help to mitigate   |

### Large-angle photon vetoes

Need good detection efficiency at low energy  $(1 - \varepsilon \sim 0.5\% \text{ at } 20 \text{ MeV})$ 

Baseline technology: CKM VVS Scintillating tile with WLS readout

Good efficiency assumptions based on E949 and CKM VVS experience

**E949 barrel veto efficiencies** Same construction as CKM

#### **Tests for NA62 at Frascati BTF**

#### Tests at JLAB for CKM: • $1 - \varepsilon \sim 3 \times 10^{-6}$ at 1200 MeV

## Charged particle veto

 $K_L \rightarrow \pi ev$  can emulate signal when both  $\pi$  and e deposit energy in MEC

- Fake  $\pi^0$  vertexes from  $\pi e$  all reconstructed downstream of true decay
  - $-\pi^+$  deposits only a fraction of its energy
- $K_{e3}$  decays with " $\pi^{0}$ " reconstructed in FV have  $z_{\rm rec}$  < 200 m
  - All within the acceptance of the CPV

### **Baseline CPV design**

Square scintillator tiles, 5-mm thick, supported on carbon fiber membrane

• 2 planes  $\rightarrow$  3%  $X_0$ 

Tile geometry: 4x4 cm<sup>2</sup> or 8x8 cm<sup>2</sup>

- Smaller tiles near beam line •
- Cracks staggered between planes •
- 4 chamfered corners (45°) for direct SiPM coupling

# **Charged particle rejection**

 $K_L \rightarrow \pi ev$  can emulate signal when both  $\pi$  and e deposit energy in LKr

# Use cluster RMS in LKr to identify and reject $\pi$ interactions

• Geant4 confirmed by preliminary analysis of  $\pi\pi^0$  events in NA62 data:

$$\varepsilon_{\gamma} = 0.95$$
  
 $\varepsilon_{\pi} = 0.05$ 

If LKr replaced by shashlyk, longitudinal shower profile information also available

# Ratio of hadronic/total energy effective to identify $\pi$ showers

• Preliminary results based on Geant4:

$$\varepsilon_{\gamma} = 0.99$$
  
 $\varepsilon_{\pi} = 0.07$ 

Study of HAC (MUV1/2) response in NA62 data in progress

 Parameterization of response for inclusion in fast simulation

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 33

# Concept for preshower detector

### Advantages

- Redundancy for rejection of  $K_L \rightarrow \pi^0 \pi^0$
- Partial event reconstruction for calibration channels
- Sensitivity for exotics searches e.g.  $K_L \rightarrow \pi^0 X, X \rightarrow \gamma \gamma$  with displaced vertex

#### Issues

- Implications of extra material on MEC  $\gamma$  efficiency
  - Place material as close as possible to MEC, so energy from preshowering γs cannot escape
- Enough to establish partial redundancy if 50% of pairs have at least 1 conversion:
   → 0.5X<sub>0</sub> converter
- Angular resolution for  $\gamma$ s dominated by multiple scattering in converter if tracking planes have  $\sigma_x < 100 \ \mu m$ 
  - $\sigma_{\theta}$  = 2 mrad from MS
  - $\sigma_z \sim 10 \text{ m and } \sigma_{m\gamma\gamma} < 25 \text{ MeV}$
- Multi-pattern gas detectors to track conversion products?
  - Micromegas, µ-RWELL?
- Data condensation in front end: only active elements read out

### Limits on $K_L \rightarrow \pi^0 X$ from $K_L \rightarrow \pi^0 v \bar{v}$

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 \nu \nu$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 35

**KLEVER: An experiment to measure BR**( $K_L \rightarrow \pi^0 v v$ ) at the CERN SPS – M. Moulson – ICHEP 2018 – Seoul – 7 July 2018 3
